>Exactly..Thats the point. You have to look carefuly, dah!

No, YOU have to look carefully. THose of us who aren;t blinded by Apple Hype
can see the differnece fairly easily. It's like those 3d stereo things.
You cannot see it until you look at it the right way (or carefully enough)
then you cannot avoid seeing it after that. Or at least I guess so, I've
never put in the effort to make those stereograms out. :)

I thought the same until I got a laser and started to compare. But then again,
most people cannot tell the difference between an en dash and an em dash, and
fewer still know how to use them properly. And many others don't know how to use
words like "they're" and "there" and "their" properly. Sure, it may be "good
enough for the masses" but some of us hold ourselves to higher standards.

Well... OK. I'm amazed. That was a bad example then, if not a bad argument.
The question is to know if Sun workstations are well suited for that kind of
software. If so, maybe soon we'll have Sun workstations at home... If only they
could replace PCs...
And how about Doom on Sun ? Does it run fine ? Does it run under X ?

|>
|> Programming X software is easy, if you use the right tools - XForms for the sun,

I guess those are toolboxes. I could say that GEM doesn't require any toolbox to
be used, but I must reckon that GEM looks simpler and less powerful than X (as I
never really programmed under X). Though, I talked about game software
programming, not specifically GUI programming.

Can anyone tell me more about the Atari Portfolio such as what it comes with, its dimensions, its weight and what it can do software and hardware-wise.

Thanks.

Dave

Well, there's a 8-bit Atari BBS running the way you will up in southern
Sweden and from what I know he don't have that problem. I think that you
should go ahead and put it up, if someone is annoying you you'll just
have to throw him out! ;)

> I suppose it is my own fault for posting into the advocacy newsgroup!!

When you refer to the GUI as a "WIMP" interface, you certainly make yourself look like one of those "guys who are to 'macho' to use a mouse." We've all seen them before - GUI haters... they say GUIs are "for wimps." Perhaps if you meant "WIMP" to mean Windows Icons Menus and Pointers (as you said to me in E-mail), then you should define your acronym at the beginning of your post. I contend that "GUI" is a term used further and wider than "WIMP."

Instead of blowing all that hot air accusing me of twisting facts, and flooding the newsgroup with rhetorical questions about why you post here, you could have SIMPLY STATED THAT WHAT "WIMP" MEANS here on the net, and understood that it was interpreted by me as a derogatory term. Instead, you tell me in E-mail what WIMP means, then you come on this newsgroup and accuse me of distorting the facts. You could have EXPOSED the misunderstanding to all, defined "WIMP", and ended it... Instead you put on a show. I'd say your material belongs in the advocacy newsgroup....none other!

I have owned Amiga 1000, and still got 500 and a 1200. My opinion of
Amigas? The GUI is a toy. The keyboard sucked (even on the 3000). I can
trash the os as easily as M$ Windoze. Verdict? Amigas are excellent game
machines.

I was waiting for you to go off in this direction, BobR. No, I haven't "done a complete flip-flop".... No, I am not "using every means possible to bash the Macintosh."

I still maintain that the IBM has its problems. Only YOU with your "all or nothing, I'm BOBR and I'm correct" attitude could see it that way. Perhaps I should feed my text to you in little bites so you can digest the information without producing misinformation.

1st bite: The Atari ST is a fine machine. For all the things I used it for - light word processing, simple games, getting on the net in TEXT mode, it was great!! It is easier to use than the PC. It is far more efficient in terms of how it utilizes the hardware and software. For a "complete flip-flop" I would have to renege on that, and I do not.

2nd bite: It became harder for my non-expanded ST to do the kinds of things I wanted to do with the word processor. I wanted color and graphics in my documents. I could not do this with my 520ST.

3rd bite: I needed to either upgrade my RAM and TOS, or get a Falcon. I couldn't find anyone ANYWHERE who would do this reasonably, and I couldn't justify paying $300 plus mailing my ST across the nation to get 4Mb. Likewise, I couldn't justify $800 for a minimum Falcon, because I'd soon spend double that when I got more RAM, HD, 32Mhz, etc.

4th bite: Papyrus was the word processor I would have needed, but it cost $180 from TOAD. The complete Microsoft Office for the PC cost that much. I didn't even want to spend that much when all I needed was a WP sort of like Microsoft Works, which is free with many PCs.

5th bite: I figured that since I would be upgrading to at least Falcon class performance, I'd like to get on the WWW too. I couldn't even find a WWW browser like Mosaic for the Atari at all.

6th bite: I couldn't find ANY way to get an Epson Stylus Color printer driver for a ST or Falcon, nobody I asked when I called the long-distance Atari store knew ANYTHING about it.

7th bite: I decided that to overcome all of these problems, I would have to spend thousands on a Falcon, HD, RAM, 32Mhz upgrade, Papyrus, and hire a team of programmers to develop a printer driver for the Epson Stylus Color and a WWW browser. I'd be doing this simply to "stay with the Atari name", and likely have a system with near-zero resale value, despite what it cost me.

8th bite: It dawned on me that it would be easier and more economical to forget brand name loyalty in computers and take a look at the computers that ALREADY CAN DO the things I want in terms of hardware **AND** software. This lead me to look at the Mac and PC. Since the Falcon won't run most of the ST games I had anyway, I couldn't slight the PC and Mac from a personal viewpoint for not being able to run my existing software, since it appeared NO platform would. Furthermore, since there is hardly any new Falcon software/games coming out, what would I be missing if I didn't get a Falcon?

9th bite: I wanted the cheapest system that would meet my needs, and the one with the most software available. Although the Mac would likely do the things I wanted and prices for the Mac are a lot more competitive than they used to be, I still found the PC to be cheaper, and I found the **VAST** software base to be attractive. I like all the gadgets (flight yokes, etc) and although there are joysticks/etc for the Mac, there are fewer and they come out later.

10th bite: I went to Office Max and found a Leading Edge 486/66 with 8MB/420MB, 1MB SVGA, double-speed CD-ROM, 16-bit sound, 14.4 Faxmodem, speakers, (etc.etc.) for $999 and it came with MS Works and tons of software. It was only a little more than a stripped-out no-HD no-CDROM no-modem no-Papyus Falcon.

11th bite: I looked 10 feet to the left and saw the Epson Stylus Color with all drivers included for a PC **OR** Mac. I bought one; no need to hire a team of programmers after all.

Final comments:

Although I went with the PC, I ***BY NO MEANS*** find it to be a perfect solution. I feel in NO WAY bound to the platform. The only reason I didn't pick a Macintosh is because it wasn't cheaper, and there aren't as many little gadgets to plug in, there is less software. Perhipherals are a little more scarce, etc. If things change in the

future - if I can get a Power Mac for less than a '686 - and if I find Power Mac software in places like K-mart, Costco, Target, Wal Mart as frequently and in as much abundance as PC software is now, and if there are THOUSANDS of people making cards/etc for it - then I will get a Power Mac.

In order to do the things I need to do with my Atari wasn't even possible - it wasn't an option. I could come as close as possible, but it would have cost me TONS more and there'd be no resale value. When I finish with this Pee Cee, some fool will take it off my hands. Does this mean I flip-flopped? Flip-flopped from what? Do I Atari-bash? Have I called the ST names? No....I don't recall that. Have I flip-flopped from my position of thinking certain things about the Pee Cee SUCK? Nope...I still think those things suck. I think IRQ conflicts SUCK. I think segmented memory SUCKS. I think loading a half-dozen TSRs SUCKS. I think juggling memory in an 8MB machine so I can get 640K free TOTALLY SUCKS. Do you think I'm afraid to say those things just beacause I use a PC? You're wrong....I haven't "totally flip flopped." I never said that a PC wasn't worth having during ANY of our arguements. I still stand by the things that I said about the ST - it still works, it still serves in many ways.... I can't help it if my needs moved just beyond what my ST could do, and I can't help it that the Falcon just isn't economical. I won't stand for people saying that the ST is as difficult to use as a PC (as you so naively implied) - because the fact is now I have to dick around with AUTOEXEC.BAT and CONFIG.SYS and I didn't even have those on the ST - I'll miss that.

I don't believe myself to be perfect. I don't believe my computer to be perfect. I don't believe my car to be perfect. I don't believe anything to be perfect. Yet, I use those things. I will defend my stuff to a point, however....like when I use an ST and someone tells me that it us just as easy to use a PC (like YOU), or when I drive a Porsche and someone tells me that a Dodge Neon is a better car for less money... I won't stand for mistruths, but that doesn't mean that I have to believe my stuff is perfect. You, BobR, on the other hand.... You use a PC, and you won't stand to have someone criticize AUTOEXEC.BAT, CONFIG.SYS, memory juggling, IRQ conflicts...etc.....because YOU use them. Well, to everyone else: I use them to, and they DO SUCK. THis doesn't mean I find them difficult to deal with personally, but I still think they suck. Despite all the things that suck, my PC met the criteria for purchase, which is why, in all its imperfectness, it is sitting on my imperfect desk. Enjoy your perfect world, BobR.

James

Exactly, you have to look carefully. Excuse me what does it matter if it is an Apple StyleWriter, it's not hype. Than again you hype anything Atari does. I recently handed in a Research Pathfinder that looked marvelous as far as styles of text and my Prof did not look at it carefully.

Chris, you are just spewing for nothing because you are mad because the Mac stomped the ST and Atari silly.

> |> computers. its natural for people to get personal in advocacy.
>
> Particularly when we see too much stupidity, contradiction, nonsense and
> irrelevance. Do you still understand, Peter ? Do I speak the right language ?

Oui...Now back to the Amiga. So sports fans, what do you think of the Amiga in
the hands of Escom. Can the new owners bring out an 020 Amiga 1200 and 030
Amiga 4000 that will do well or just the 040 Amiga as their flagship until new
Risc ones are out?

Escom needs to manufacture and price the A4000 at around $1500 for a complete
system. If Escom can do that, Video Toaster sales will go through the roof. I
would even buy one..

:> I recall that he said "You can get a laser printer for the Mac for less
:> than $300."

:Interesting that you put quotes around that line.. you must be VERY sure
:that's EXACTLY what he said. That's not the way I remember it.

But that is the way I (and just about everyone else in this newsgroup)
remembers it. In any case, I trust my memory more than I do yours,
especially after reading some of your posts. And even if he didn't
say it exactly like that (and he did), he certainly meant it since he
cited two inkjet models as examples of $300 "laser" printers.

:> Looks like you're an idiot.

:Looks like you're an Atari Bully Boy who's never wrong, right?

No, I've made my share of mistakes (like bothering to read your posts).
I already admitted that my statement that "there are no $300 laser
printers" was wrong. What I have been arguing is that that is a moot
point since Pete wasn't referring to laser printers.

:> Mind disclosing your true identity, Bob? At least Sinclap has the courtesy
:> of posting his garbage under his real name.

:No problem.. my name's Bob...

That's real informative!!!! <much sarcasm>

But this is better:

:My name is Bob Retelle, I'm a Sysop in the CompuServe Atari Computing
:Forum and the Atari Gaming Forum...

Thanks for finally being being a real man and disclosing your true
identity. What I'd like to know is why the hell are you an Atari
sysop when you hate Atari so much!? And why the hell are you sticking
up for Atari-group net-pest #1 (Sinclap)?

:I won't bother with the rest of my "credentials", but you might say I know
:a bit about Atari and Atari computers.

Good, because your credentials don't seem to be that good.

:What ANY of the garbage I've been seeing on "atari".advocacy recently has
:to do with Atari is beyond me...)

It is ADVOCACY, what do you expect?

> Risc ones are out?

Amiga wouldn't have gone tits up to begin with if the market hadn't dried
up. Why would anyone waste their time on proprietary machines, much less
020 or 030? An 030 was cool in 1990! Pretty soon the 040 Macs will all
be history.

I can't see anyone wasting the R&D on a proprietary Amiga RISC computer.
Hell, they'd be dumb to go with anything but a Power PC chip for RISC,
and they'd be dumb not to adhere to the PReP standards if they go with
the Power PC..... So basically, what the "new Amiga" would have to be is
a Power Mac clone.... What would be Amiga about it? I contend that
any attribute that "made it an Amiga" would simply be a step in a
proprietary direction. There's simply no room in the **MAINSTREAM** PC
market for more than a couple of standards. That goes without being
said, as Atari quit and AMiga went belly-up already. I wonder what
magic tricks Escom must be planning; they'll certainly need magic to
shoulder their way in on the PC/MACs. When/if MAC clones become more
prevalent, the situation will intensify, competition between Mac clone
makers will drive MAC prices down. Competition between PC clone markets
and MAC clone markets will drive clone prices of both platforms down.
How is AMiga going to compete with its proprietary designe when Taiwanese
factories are cranking out "once size fits all" motherboards full tilt,
which go to hundreds of vendors? If the Mac market endures, they'll be
cranking those out too.

> Escom needs to manufacture and price the A4000 at around $1500 for a complete
> system. If Escom can do that, Video Toaster sales will go through the roof. I
> would even buy one..

Whatever it is that the Video Toaster does, I'm sure the technology can
be implemented on a "non-proprietary" computer. Sales of *THAT* would go
through the roof. $1500 for an A4000? I don't think it would sell when
you can get a Pentium for that. I wouldn't pay more for an A4000 (in any
form) than I would an Atari Jaguar....because I'd use them for much the
same thing, and their both sort of like "proprietary little computers."
Fact is, the Jag is 1/10th of the $1500 and I can afford to throw it away
when it becomes obsolete.

You asked for it..

Tentative dates that have been floating for the new PowerMacs...

May 15

-Performa 5200(aka LC5200)
-Powermac 6200(Crusader):630 case, PPC 603. The rumor price is around
$1300(w/cdrom?)

June 19 or 26

-Tsuanami(?): the first 604 PCI Mac

July or August

-TnT
-Nitro

August 28

-PowerBook PC 2000 and 5000 series
-PowerBook 190

September and beyond

-Cataylist
-Alchemy

There you have it..

:You equate "advocacy" with "bullshit"? Puh-leez.

Well, I read most of the c.s. advocacy groups, and from what I have
read in them (especially this one) that is the conclusion that I have
come to: That advocacy groups are for bullshit. And they are. The
reason why they were created was to keep all the flame wars and garbage
off serious groups, like c.s.atari.st, c.s.powerpc, and r.g.v.atari
(though it hasn't worked out in the case of r.g.v.atari). In fact, I
read once in c.s.amiga.advocacy that that group was created specifically
to keep Marc Barrett (the #1 Amiga newsgroup troll) out of the rest
of the c.s.amiga hierarchy. So, yes, advocacy (on usenet at least)
is pretty much equivalent to bullshit.

Not that that makes all of Peter Sinflop's garbage acceptable. Even
in .advocacy one shouldn't waste bandwidth by quoting 50 lines of text
(totally unedited) and only adding one or two childish half-liners.
The out-and-out slander that he regularly employs to put down everyone
on the Net whom he dislikes is also totally unacceptable (he loves
to call people racists and homos).

But there is nothing wrong with saying that "Atari sucks" or even "The
Mac kicks Atari's Ass" on advocacy (though it's prefered that you present
facts and figures to back up such claims, something Sinflop never does).

If you want any REAL information about Atari and its computers, I would
recommend c.s.atari.st or one of the other (real) newsgroups in the
Atari hierarchy. If you want real information about the Jag you are
out of luck since r.g.v.atari, thanks to Sinflop, Willbill, and a bunch
of other jerks, has degenerated to the .advocacy level.

What is the current tentative release date of the new 604-based Power Macs (I know you know this)? I plan one purchasing a 75-MHz Pentium clone (soon!), but don't want to do so until Apple releases their new Power Macs. I know the tentative release date a month ago was May something, but I haven't kept up to date on PowerPC stuff the last few weeks due to a heavy work load. And knowing how the computer industry works, I'm pretty sure the release date has slipped since them.

So what models will be released on what dates?
Also, when is Copland supposed to be out now? 1997? Just curious.

Thanks in advance for the info. Please respond via e-mail so as not to clutter up this group.

* Tom

PS: To everyone else - Sorry for wasting bandwidth with this totally un-Atari-related question. I will remember to use e-mail next time.

The scope of this newsgroup is very loosely defined and not at all enforced. Who are you to call judgement upon it? I don't eat of of Sinflop's hand.... I post here because, frankly, it's fun to take on some of the users.... I agree some are hopeless, but this is a form of crude entertainment for me. When it ceases to be, I'll be out of here too. However, I won't try to be as "dramatic" about it as Steve.

>
> I suggest a name change for this newsgroup: comp.sys.atari.not

Somehow I won't be surprised if the name of the newsgroup does NOT change; I think your suggestion has gone to waste. I'd suggest saving your suggestions for situations in which someone (anyone) gives a DAMN about them....such is not the case here.

>
> Adieu, folks. I'd like to say that it's been fun, informative,

Actually, I'd just as soon see this information too. True, it's not necessarily an Atari-related question in the direct sense, but this is an advocacy newsgroup and as a recent Atari user, I myself would be interested in seeing where current Atari users upgrade too. Since there are no new Atari computers and Atari users have to go somewhere, I find it relevant to discuss the other platforms in this newsgroup, to a certain extent.

> No, I haven't "done a complete flip-flop"....

Oh really..? If you knew how to read, you'd be able to tell what I was talking about... guess I still have to put it in little words, or maybe you can find someone to read it to you out loud.

You were the one who practically peed his pants when I dared to suggest that a PC is not as difficult to use as YOU said it was. (I never said it was perfect, or didn't have any problems.. you made that up in your own little head).

Now, in a frantic attempt to bash the Macintosh, you've suddenly done a double back flip, triple toe-axel, loop the loop flip flop and are wasting volumes of Atari newsgroup space telling everyone how great the IBM is, and how much space stores devote to its software (like we didn't all already know that) compared to the shelf space devoted to Macintosh software. You've also gone on at length about how great IBM games are in comparison to Macintosh games. You've declared the Macintosh dead because it's not a "standard" system, unlike the IBM (which up until recently you were spewing volumes about how bad THAT was).

> No, I am not "using every means possible to bash the Macintosh.

Sure sounds like it to me.

>Do I Atari-bash? Have I called the ST names?

Nope.. and if you knew how to read, you'd know I never said you did.

What I DID say was that you haven't uttered the word "Atari" in this newsgroup in a long time. Instead you've been using the Atari.advocacy group to bash IBM, Macintosh, Peter Sinclair, me, and now Amiga.

Here's where we get to the good part:

> The Atari ST is a fine machine. For all the things I used it for
^^^^ (past tense)

> light word processing, simple games, getting on the net in TEXT mode, it
> was great!!
^^^ (past tense)

I see,,, so you're now a "former Atari user".

> I went to Office Max and found a Leading Edge 486/66

Great... sounds like a nice system. Have fun with it.

I guess that means we can look forward to your finding a more appropriate newsgroup to post your IBM, Macintosh, Amiga, etc.. bashing in.

See you around... stop by in the Atari world now and then.. oh.. and see if you can find an alt.reading.remedial newsgroup while you're looking for a new home for you and your Leading Edge...

Bye..!

I don't believe in 25 line space-wasting "sigs" with cute ASCII pictures
in them, so until I can figure out how to get this mailer to append my
name to the "From" field, BobR will have to do.

> What I'd like to know is why the hell are you an Atari sysop when you hate
> Atari so much!?

I'm an Atari Sysop because I use and love *Atari Computers*. I also enjoy
helping people to use Atari computers and get the most out of them.

I *don't* love the company which made them, that's very true.

> And why the hell are you sticking up for Atari-group net-pest #1
> (Sinclap)?

It's too bad you have to interpret everything as "you're either WITH us, or
AGAINST us".

What I've been doing is defending a statement I read here which was RIGHT,
but which everyone else said was WRONG.

(Heck, I'd even "stick up for" James Wood if he was ever right about anything)

> Good, because your credentials don't seem to be that good.

Oh really..? So what Atari related magazines have you worked with and
written articles for..? What Atari User Groups have you been an officer
for..? Have you been an officer in TWO of them at the same time..?
What Atari Shows have you helped organize..? Which major online services
have you created or run Atari related areas for..? What company did you
run selling your own and others' Atari software for..? What books have you
written about Atari related programs..?

Like I said, I know a little about the Atari world.

> It is ADVOCACY, what do you expect?

No, it is Atari.advocacy... not IBM vs. Macintosh Advocacy, or Macintosh vs.
Amiga Advocacy. There are newsgroups for that kind of thing.

A reasonable discussion of printer types like we've been having here can be
just as applicable to Atari computers as any other, but the endless IBM VS MAC
stuff in recent weeks is just a waste of space in here.

It's nice to know that Amiga has been bought up by someone finally, but
pages and pages about why they're going to fail (when that's exactly what

the C-Lab Falcon and the Eagle/Medusa are all about anyway) is just a waste of space. It would be far more appropriate in an amiga.advocacy group.

MAC's were born of the seventh level of computing hell - the one that eats
all your disks, then makes you ask if you are allowed to go to the toilet
at this point.

PC's just suck. I don't need to justify that, anyone who's used one knows it.

Windows is a sad excuse for an enviroment - made my morons for morons.

Atari is dead.

Commodore too.

Acorn are where they've been for ever - stuck up their own arses.
(hey isn't that where P.S-D normally hangs out?)

All the fun has gone out of computers, I want my ZX81 back - now there was
a real machine.

I'm buggering off to the beach to watch the tide going out on what used to
be innovation, and became just another field full of grey suits.

Craig.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Hello all! Bob Retelle is being a dork again, and as usual, he's wrong about the Atari - as he is about most everything he posts about.
We were talking about the original release date of the Atari ST - which was in 1985. I'd been waiting for an ST and called the local Atari dealer on a daily basis as the time drew near, so I remember the date well. Perhaps someone intelligent can enlighten bobbie. Here's what he said:

On May 8, 1995, BobR wrote: (in the "C-lab Falcon" thread)

BR>Back when the IBM PC, the Amiga 500 and the Atari 520ST were brand
BR>new, the playing field was a lot more level (of course, the PC had the
BR>IBM name behind it, which was probably an insurmountable advantage
BR>over the other two).

I tried to correct him about this - explaining that NONE of the three were "brand new" at the same time, and can you believe he argued with me??? (1) IBM PC was new in 1981, (2) Atari ST was new in 1985, (3) Amiga 500 was new in 1986, possibly later - I'm not sure since the AMIGA 1000(!!!) was the original competition for the Atari ST and *IT* was before the 500.

!!!get a load of his smart(dumb)-ass response!!!

On May 9, 1995 in Email to me, BobR wrote:

BR>Unfortunately you don't seem to even have that much knowledge.

BR>If you knew ANY Atari history, you'd know the Atari ST and the Amiga 500
BR>were released within weeks of each other in 1986.

BR>Thus you got both dates wrong.

BR>Find one of the books on why Atari failed bigtime, and have someone
BR>who can read, read it out loud to you... it should cover that time
BR>period.

I can't believe someone can be so much in ERROR and such a smart-ass about it. Can someone please enlighten us in regards to the proper release dates to the IBM PC, Atari ST, Amiga 500, and since it's relevant to the discussion, the Amiga 1000?

I still have the January 1986 BYTE magazine with the Atari 1040ST on the front cover - and we all know that the 520ST came before....so it looks

like BobR is wrong for sure.... He'll never admit it, but give it to him anyway....

You're such a smarmy little *sshole, bobbie. Since I do know how to read, I'll ignore the rest of that sentence; it's just too stupid. Now, can you please get past the "reading" fettish and attempt to retort in a less-juvenile fashion? It's simply too time-consuming and BORING to continue on the "you can't read" fashion that you started waaaay back when.

>
> You were the one who practically peed his pants when I dared to suggest
> that a PC is not as difficult to use as YOU said it was. (I never said it
> was perfect, or didn't have any problems.. you made that up in your own
> little head).

You wouldn't even admit that IRQ conflicts, TSRs, memory juggling (segmented memory), AUTOEXEC.BAT and CONFIG.SYS were all disadvantages to the architecture!!!! Not only is it bad enough that you wouldn't admit they are are "problems", but the fact is that they are the *biggest* drawback to the Pee Cee platform of all!!!!! YOU KNOW WE ARGUED ABOUT THAT. I said that I thought a lot of inexperienced users have troubles and that these are caveats of the architecture, and you denied that.... Instead of admitting it was a problem with the PC, yet perhaps one that had to be dealt with, your ill-fated and shallow retort was based on the following 3 premises:

(1) I must be too stupid to deal with IRQ/AUTOEXEC/CONFIG/TSR/ memory juggling. WRONG!!! I can probably deal with them as well as you can. Just because I can configure a PC with one arm tied doesn't mean it's a polished product or easy for everyone.

(2) What I've mentioned (IRQ/AUTOEXEC/CONFIG/TSR/JUGGLING) are not problems at all...I don't know what I'm talking about when I criticize the Pee Cee on this basis. WRONG!!!! I cited as my evidence the fact that *all* PC innovations have attempted to (and are still heading in that direction) to remove these caveats.... hence PCI slots, plug&play bus, the anticipated Windows 95.... all to address these things that you wouldn't admit are PC problems.

(3) You then resorted to attacking the ST with a weak arguement that
it was as difficult to configure as a PC....something about some
config file on the Falcon or some bug in the Falcon that wouldn't
let it boot in hi-rez. The fact is, rather than admit that the
PC has problems (more importantly, that you were WRONG), you
resorted to naming all problems with the ST line of computers
as some contorted attempt at defending your erroneous thinking
and flawed logic.

>
> Now, in a frantic attempt to bash the Macintosh, you've suddenly done a
> double back flip, triple toe-axel, loop the loop flip flop

I don't need to "bash" the Macintosh.... It's already in second place.
I don't know about the future - it's possible things could change but not
likely within the next couple years. When I say the Mac lacks the gizmos
and excess software of the Pee Cee, YOU may use the opportunity to accuse
me of "bashing" but I hardly think stating the truth is. I'll say one
more thing about the Mac before I ask you to kiss my ass in regards to
the subject: I chose a PC over a Mac today, but the Mac keeps getting
better all the time (in all respects).

I THINK ONE PARAGRAPH SHOULD USE THE MAC EXAMPLE TO DEMOSTRATE YOUR
LIMITED, ONE-DIMENSIONAL THINKING. (capitals so you don't "miss" this
paragraph). I CAN SAY THAT THE PC HAS MORE GIZMOS, SOFTWARE, SUPPORT,
POPULARITY THAN THE MAC....AND YOU ACCUSE ME OF MAC BASHING. I SAY THAT
THE MAC IS GETTING BETTER ALL THE TIME, YOU ACCUSE ME OF FLIP-FLOPPING.
THIS IS BECAUSE YOU CAN'T SEE IT BOTH WAYS.... THE FACT IS THAT BOTH OF
THOSE CONDITIONS **DO CURRENTLY EXIST** AND THERE'S NOTHING FLIP-FLOP
ABOUT IT. You're just such dummy that you can't accept a viewpoint like
that....you only see the extremes (of which you claim to know everything
about, no doubt) and when you see me post one part of my objective
viewpoint one day and another that can co-exist with it later (like the
"chose PC over Mac/Mac getting better" scene) you accuse me of
flip-flopping....HA HA HA!! You're *truly* brilliant, bobbie.

and are wasting
> volumes of Atari newsgroup space telling everyone how great the IBM is,

If you don't like it, kiss my ass. Anyway, I was NOT telling everyone
"how great" it is....just below (my next quote) is what I was really saying:

> and how much space stores devote to its software (like we didn't all already
> know that) compared to the shelf space devoted to Macintosh software.

See the "and" that begins the above quote? It shouldn't be there....nor
the prior quote. Why? because I *NEVER SAID* how "great" it is...I said
how much software there was. You may or may not have interpreted that to
think I said "IBM is great" but that's your business. I said how much
software there was....DON'T MISQUOTE ME, JERK. That's all I said.

> You've
> also gone on at length about how great IBM games are in comparison to Macintosh
> games.

No....I mentioned that there are *more* IBM games - I said ***ABSOLUTELY NOTHING** about the quality (reference your misrepresenting use of the term "great") of the Mac games. As a matter of fact, I played "Daedulis Encounter" (sp?) on the Mac today and it was just as impressive as on the PC. The fact that it was out for Mac at the same time as the PC is evidence for "things are getting better all the time" for the Mac.

> You've declared the Macintosh dead because it's not a "standard"
> system, unlike the IBM (which up until recently you were spewing volumes
> about how bad THAT was).

First of all, I never declared it DEAD. Here you go vascilating wildly, jumping to conclusions, and making a general ass of yourself again. I said that it was 2nd place. In regards to the vast majority of installed PCs, it is not "standard" because MS-DOS is the "standard" if a standard is to be judged by installed numbers, which is generally the case.

Secondly, I **NEVER*** made VALUE JUDGEMENTS about how "good" or "bad" the PC was - I simply MENTIONED THE SHORTCOMINGS OF THE ARCHITECTURE and **you** (in all your ignorance) couldn't be man enough to admit that there ARE shortcomings (the ones I've mentioned repeatedly throughout this message and won't anymore). So, since you won't admit the PC caveats (nor that you were wrong), you accuse me of making a "bad" PC value judgement.... When the truth is revealed that I believe the PC is viable despite all it's shortcomings, you accuse me of flip-flopping!! HA HA HA!

>
> > No, I am not "using every means possible to bash the Macintosh.
>
> Sure sounds like it to me.

You're a simpleton, that's why. I take more into consideration than you, I don't go to extremes, and just because I criticize on one account yet don't condemn entirely, you can only interpret that as bashing or flip-flopping. You're a simpleton indeed.

>
> >Do I Atari-bash? Have I called the ST names?
>
> Nope.. and if you knew how to read, you'd know I never said you did.

More childish "can't read" rhetoric.... pretty poor filler and a very dull retort.

>
> What I DID say was that you haven't uttered the word "Atari" in this
> newsgroup in a long time. Instead you've been using the Atari.advocacy
> group to bash IBM, Macintosh, Peter Sinclair, me, and now Amiga.

Hey everybody!!! I FIND FLAWS WITH EVERY SYSTEM (because no system is perfect and they all have flaws) SO BOBBIE ACCUSES ME OF BASHING THEM ALL!!! Heh heh heh! You're so wall-eyed it's pathetic.

I've been at odds with Sinclair, but to tell you the truth, you're not even a wart on the ass of Sinclair.... Your ego is several times larger than your cognitive capabilites and you run your mouth much more recklessly. At least Sinclair's posts do have *some* substance *some* of the time....you insult Sinclair by trying to buddy-up with him. I've seen Sinclair be accused of flaimebaiting on many occasions, but you are an order of magnitude worse.... You even pick up Sinclair's arguements, coming half-way, not knowing what you're talking about or what the point is, and ramble on for weeks about insignificant issues....the $300 laser printer....didn't think you'd ever let that drop.

>

> I see,,, so you're now a "former Atari user".

I still have a roomful of Atari computers that would bring tears to the eyes of any Fuji-lover. Pretty impressive how you picked up on those past tenses there, bobbie....they were so obscure that they might have been missed had you not pointed them out.

>
> > I went to Office Max and found a Leading Edge 486/66

It works well - it does lack character, however.

>
> I guess that means we can look forward to your finding a more appropriate
> newsgroup to post your IBM, Macintosh, Amiga, etc.. bashing in.

No, I still own Atari computers (which is why I will be in the Atari newsgroups), but don't use them *exclusively* at home anymore.
Your guess (as usual) is wrong.

>
> See you around... stop by in the Atari world now and then.. oh.. and see if
> you can find an alt.reading.remedial newsgroup while you're looking for a
> new home for you and your Leading Edge...

Please, if we're going to argue, try to drop the childish "remedial/can't read" lines.. While I understand that you intend for them to sting, they really don't and they make you look stupid and your arguements specious. Rather than continuing in that childish direction, why don't you attempt to spice up your retorts with a little factual substance?

I have the same feeling. I don't even know if I would update from my ST to a new
computer if I had the money. The Falcon was a good choice but it's less true
today, and things will get worse until the release of newer and cheaper clones.
Are there reasons to hope ?
I miss my Philips Videopac with its assembler programming cartridge...

Well, this seems to be a relevant newsgroup, so here goes...

I need to find a source for the bus connector on the old Atari Portfolio. In case you haven't seen it, I would best describe it as a miniature centronics port...raised center flanked by 2 rows of pins. Not a stock item at Radio Shack. :-)
THANKS!

While I wouldn't say that ALL the fun has gone out of computers...the initial thrill has died off a bit. Back in the days when you got your ALTAIR 8800 kit, or put together your first ZX81, it was a different world. The market has evolved...and so must we.

To an extent, though, I agree with you. Sometimes I just pull out the old Tandy Model 100 laptop, and less frequently the Kaypro and Osborne, and reminisce about the "good old days." What can I say? I get nostalgic!

> I'm buggering off to the beach to watch the tide going out on what used to

Spoken like a true prick, bobbie... You know what's funnier than that?
The fact that a real brain-dead moron like you thinks he can use ridicule
to make himself look like a smart-ass.... Forget it, it doesn't work.
All I've ever seen is "GUI" and I really don't give a rat's ass about the
origin of the term.

The entire point of the arguement was that I misinterpreted his use of
the term "WIMP" to be derogatory. You find this to be so humorous that
you almost fell out of your chair. Good for you. I'm sure you hold high
credentials, are a real acheiver, and you're soooooooo intelligent that
you can feel superior. There... Does that make you feel better? Is
that what you want to hear? YOU REALLY MISSED the point....simply the
misunderstanding, and took this opportunity to try and spout off and make
yourself look like some goddamned expert. Piss on you.

Mr. Schmitt, Boss of Escom, has authorized me to publish the state of
affairs.

Most important item first I have my job, and its the of the worldwide
boss of engineering. Yes, I know, I start into a very difficult task,
as successor of real celebrities. OTOH I had eleven years time at
Commodore to study what is the wrong strategy and which leads to success.
I will spend all effort to avoid these known errors.

And now for the big picture There will be founded a new, completely
selfstanding daughter company of Escom AG. It will have own rooms at
an own address in Heppenheim. It will be the headquarter of the new
company, with control and coordination for the whole world. One subsidiary
will exist in any case in the Netherlands, and it will do Europewide
distribution and sales. Further country subsidiaries are not impossible.
Yet there are no concrete decisions about UK, USA, and Canada in particular.

The new company is yet to be founded, but this is currently in the works
with griga Developer Support Programm
ADSP will get reactivated ASAP. About those developers currently using
BIX or CIX, we have not yet decided. These people should feel free to
contact me directly at this private account (no company one (yet(
existing) and giving some input. In the past years there was a split
among the developer community into different communication channels. Thus
no direct communication of the developers among each other was possible,
and for engineering this meant double work to explain the same issues
once on one net and then additionally on another net. We will do everything
to avoid this nonsense in future. There are big obstacles, as there are
big cost differences in different regions of the earth, and simultaneously

a high degree of coitely be the
port to some RISC platform. The choice of this RISC is still open. There
are ecstatic advocats for at least two alternatives, PPC and HP PA RISC.
Chris Ludwig gave an interesting interview about this. It will be the
first task of engineering to prepare this choice of paths into the
future with all possible expertise.

It has been decided to be very liberal in regards of licensing in the
future. So, whoever wants to build e.g. an Amiga Laptop or a settop
box, can get chips and OS!

As you all see, much of this is still a letter of intent. The points which
are declared as still open are (really(open, so theres no use in
bombarding me with further questions.

As my work load, at least now in the building phase, will be immense,
I cant guarantee my presence on the net like before. But who knows me,
knows that that would be most painful for me myself. So lets look
forward.

In the next weeks there will be press conferences to tell more and
more details.

Long live the Amiga and for a good cooperation.

Best Regards, Dr. Peter Kittel //

James,
<Regarding IBM and Mac arguments in this newsgroup>
Arguments about other platforms in this group should be related to
Atari computers in some way. Atari may no longer make computers
but that doesn't mean that people aren't happy with their current
systems and would like to inform others of the joys of using Ataris.
Personally, I plan on getting an Atari 8-bit to complement my Falcon030.
Why? Because they are fun to use, are cheap, and have tons of available
software. There are still plenty of reasons to advocate the Atari line
of computers.
If I want to buy a different system (which I don't forsee happening)
then I will check out the mac groups and the IBM groups. However,
I own an Atari and want to read about Atari-related stuff in the
Atari groups.
I agree with the original "Eat My Shorts" post. All the fun is gone
from computing today. I cringe every time someone asks me if I have
a Mac or a PC.... as if there are no other choices! I also hate
posts mocking older hardware regardless of if it serves the needs of
the user. Some people have such little tolerance for people with
different tastes.

This newsgroup is supposed to talk about Atari, not the Amiga.
There is enough newsgroup for everybody to talk in the right place.
So please stop that...

I think both amiga and atari computers are good machines, but
it is the user who use the machine, not the people who are talking about
it. Each computer has its own problems and advantages. It is the purpose
of the "advocacy" groups to talk about that.

He is, I bought my Atari 520ST (on-disk OS) in Sept 1985. The Amiga 1000 was JUST coming out, and the 500 came out about 2 years later.

He's just plain wrong.

Ah ! Ah ! Another Sinclapish truth ! It's true the ST was released in 1985, but the public DID care. If I remember, when the Amiga was released, it was not really considered as a good choice compared to the Atari, because of the lack of software (doesn't this story reminds of anything ?). After all, you Peter were not yet born to see this, so I'll pardon you.

Boo! Hiss! Amiga info? ;-) I am curious why it was specifically posted to us Atarians, though.
You know what be a very nifty move for a new Amiga machine? How about liscencing TOS for it as well? That'd make me take notice. Then, finally, Atari and Commodore users would be cooperating instead of pointlessly flaming each other. The real enemy is Microsoft, people!
Besides, making TOS available would increase the market for the machine.

45 lines of "drivel" which proved you wrong....a fact which must hurt you badly, bobbie.. I'll be the judge of what I contribute here - the thread I've been engaging in with you has contributed very little, admittedly. However, let me remind you that you are in the same boat.

If all you can do is call a post which proves you wrong as "drivel" and ask the poster to "lost himself", do you think your opinion of my "contributions" to a newsgroup are of any significance to me? Think again. Have a nice day, bobbie.

Wasted - you'll never understand them. You must be pretty good at counting lines, bobbie.... I'll print you up a certificate of merit if you'd like. Your messages have been comparably lengthy, a comparable waste of time and bandwidth, so don't believe you're not equally guilty.

>
> So far the only contribution I've seen from you to this newsgroup has been
> to waste people's time and disk space.

Heh heh heh....as if you've been any less guilty. I'll admit lots of what I've posted was nonsense to most people - because I'm reasonable. The reason I did it was in an exchange with you.... I've entered into a pissing contest with a skunk.

>
> I'm glad I don't have to pay to download your rambling tripe, it's just too
> bad that there are a lot of people who do have to pay for it...

Aren't you just "the innocent one" bobbie.... I can't believe you'd argue (while being wrong) until you're blue in the face, and when the exchange gets to a level that you can't handle - and I don't mean name calling - I mean when counterpoints are presented, you duck out and don't address the counterpoints, but accuse the other party of wasting time and space in a most hypocritical fashion, after YOU'VE been just as guilty. Yes, I've been guilty of wasting time and space - it's been becasue of YOU, and don't think that YOU are any less guilty....we both are.

>
> Do us all a favor and find a different newsgroup to pollute.. OK..?
>

Just because you've asked nicely, I WON'T! I'd advise you to drop the "us" in that sentence and SPEAK FOR YOURSELF. I don't doubt there are certain factions that would like to see me go, but since I've been in a pissing contest with a skunk, I'm sure they'd like YOU to go as well.

However, since YOU are the one trying to score points with this crowd and not I, I really don't care. I'd just as soon end the flame war since my time is valuable and the fun is about over - for no other reason. I'm sure the other readers of the newsgroup will rejoice. Why don't you signal a truce or defeat, or just ignore it? Can you?

James

PS - you still think the Atari ST debuted in 1986 instead of being covered in the January 1985 Byte magazine?

Rod,

We have been Falcon developers since 1992.

Our details on in the signature below.

You can read all about our product on our web site at:

www.tecnation.com/tecnation/

Click on PRODUCTS and then on SONOVISTA.

Best use Netscape.

We require Falcon 030 4/x. So if you can get them for us, I will be greatful.
(Ideally with internal hard drives.)

Regards and thanks,

Alex Blok

The Amiga was supposed to have been released before the ST but didn't
make it out in numbers until about a year after the ST was out. Whats with
sinflop espousing the Amiga anyway, I've seen him on the Amiga groups slagging
it off?

: Oh yeah - nice to hear that Commodore are going back into production again

The C-Lab falcon is outrageously expensive and the other two machines you
mention hardly have much a presence, do they? They aren't even Falcon clones
- just STs with fast processors. Even the A4000/040, although hardly new and
in need of an update, is still ahead of any commerically available Falcon
class machine with an 040 and proper expansion slots. You can also now get
060/50mHz boards for the A4000 and 64-bit chipset gfx cards which make it
a considerably more powerful machine than any Atari. The only real advantage
of the Falcon is the DSP (which is still relatively poorly supported in
commercial software). Oh, and an Escom press release talked about building
Amigas with 060s in them 'out of the box' as well as possible case
redesigns for the high end Amigas. This translates into an A4000 type machine
with 060 and decent expansion space - which is pretty tasty.

Be sure to let us know when Atari go back into production of computers
again, eh?

Use Emplant's upcoming ST emulator.
I must admit that I never have owned an ST, but owned a 400, and preferred it to the 64 I owned. Since the Amiga is the daughter of the 400 line, it was a natural choice. I always thought a union of the Amiga and the Falcon would be a far better choice than the unproductive flaming of each other--each is complimentary. I don't know how to do it though.

1323. FALCON BASED PRODUCT...

Newsgroup: comp.sys.atari.advocacy
Date: 1995-05-11 00:00:00 UTC
From: alex@tecnation.com
Message-ID: <alex-1105952337010001@tecnation.com>
Source record: 12774

I thought readers of this newsgroup may be interested in our Falcon based product.

You can read all about it on the web at

www.tecnation.com/tecnation/

click on OUR PRODUCTS and then on SONOVISTA.

SONOVISTA is installed in top clubs worldwide and does things that are impossible on even today's PCs and Macs, and is a tribute to the power and versatility of the Falcon.

For the first time since my company became Atari Falcon developers in I think 1992, I will publically say that I believe Atari should have kept the machine alive. It's incredible versatility is unmatched.

(Atari did and continue to give us excellent support for the Falcon.)

Anyway, we need Falcon 4/x's with internal hard disks because despite all the hype with other products, there's a market for SONOVISTA and it's getting hard to obtain Falcons. We would prefer new ones if possible, or used ones in excellent condition.

We're compiling a database of those with machines for sale. So if you contact us, we'll log your reply, and when we need a machine, contact you.

Thanks,

Alex Blok

: entertaining, enlightening, or at least something generally
: positive....but I can't.

: >
: > I'm outta here.

: Good riddance!

....Seems that a whole lot of conversation took place here without a whole lot of positive results. Is it any wonder, that folks like myself spend their time reading such drivel. I suppose we have nothing else to do and when the newsgroups say Atari Advocacy, we just jump in and try to be an advocate. We are that. We own and use about 8 Atari ST,MegaSTE TT and Falcon computers in our daily quest to publish an Atari Monthly magazine. I guess you could say we are advocates. We enjoy being Atari boosters and hope to gather more of the faithful to the Atari cause.

We enjoy using the computer, have not found many shortcomings, and can publish a monthly magazine with the tools available to any Atari user.

We make money by using the computer, you can't ask for more than that. I suppose it is like flying a plane. You can have fun with an ultralight or a glider, but some folks just have to keep getting more power and more power all the time, even though they only fly about 3 times a month anyway. Me, I have always wanted a Piper Super Cub tandem seating and lots of fun. Oh, it would also be nice if I was a pilot, but I don't have to be to write about it. I just have to want to. I suppose that is the

feeling of those who boost and bolster the Atari tradition of very dependable hardware that does what most other computers can do.

Color me an advocate...Regards, Rod MacDonald

:You asked for it..

:Tentative dates that have been floating for the new PowerMacs...

:May 15

:-Performa 5200(aka LC5200)
:-Powermac 6200(Crusader):630 case, PPC 603. The rumor price is around
:$1300(w/cdrom?)
^^^^

$1300!! This is intriguing. What is the clock speed of the $1300
PM 6200? The 6100 I was looking at (and cost $2000) ran at 66 MHz,
the slowest PMac speed. This is true, they are undercutting their
current PMac models by about $700.

I'm going to have to look into this. $1300 is a very good price for
a PMac (or any decent computer for that matter). Even if it doesn't
come with a CD-ROM drive, the model that has the CD-ROM in it probably
only costs a couple hundred more.

Thanks for this info, Sinclap!

* Tom

1328. Hey Sinflop! Guess who's getting a Mac!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-05-12 00:00:00 UTC
From: trauth@paul.rutgers.edu
Message-ID: <3p0sq8$9mu@paul.rutgers.edu>
Source record: 12779

My sister is getting a Mac. She intends to use it next year in med school. We haven't decided what model yet, though my recommendation is the 6100/66 since they are similar to the Centrises (which she is familiar with). Also, by getting a Mac that already has a PowerPC chip she will be spared the pain of having to upgrade it later (my sister isn't the sort of person who likes to fiddle with the internals of computers). She will probably get a $200 inkjet (your favorite kind of printer) to go with it since her current dot-matrix printer is (of course) totally incompatible with the Mac. So, it looks like Ronald McDonald will be coming to my household sometime soon.

Now that I've wasted a paragraph of bandwidth on Macs, I will make a paragraph on Atari. More specifically, on the Jaguar. I have lost track of the Jag lately due to finals and other such nasty things. Does anyone (Mark?) know what the current userbase of the Jag is? Also, how many Jag games are now out (and how many of them are good)? I saw a Jag ad (though no Jag) in a central Jersey mall software store (I think it was Babbage's) about a month ago, but besides that have seen no Jag things whatsoever anywhere.

Thanks for your help,

* Tom

: and other such nasty things. Does anyone (Mark?) know what
: the current userbase of the Jag is?

No. No one does, though flamers and advocates sure post different
figures. I'd ignore anything you hear until Atari makes a formal
announcment ... even the magazines conflict on this.

Also, how many Jag
: games are now out (and how many of them are good)?

Your in luck. I've been taking note of opinions on the Jaguar
games from various Jag owners. This is what I could come up with:

```
=====================================================================
Excellent Games
=====================================================================

1. "Tempest 2000" (Llamasoft/Atari)
----------------
Type: Arcade
Good Features: Highly addictive gameplay
: Incredible Soundtrack
Minuses: Graphics aren't the most impressive on the system, though not
bad, either.

2. "Aliens Vs. Predator" (Rebellion/Atari)
-----------------------
Type: 1st Person adventure
Good Features: Great graphics and sounds
: Eerie atmosphere
: Lots of depth
Minues: Frame rate is a little slow
: Some loading time
: A few quirks ad to the difficulty of the game

3. "Iron Soldier"
-----------------
Type: Simulation
Good Features: Good use of polygon graphics
: Highly playable
: Neat animation
Minuses: Sounds are a little weak in comparison to the rest of the game

4. Doom (ID Software/Atari)
---------------------------
Type: First person adventure
Good Features: It's Doom
```

: Extra levels from the computer version
: Networking capability
Minuses: Resolution is low, though use of colors makes this less evident.

==========
Good Games:
==========
1. Hoverstrike (Atari/Atari)

Type: Arcade
Good Features: Fully texture mapped
: Great graphics
: Fun to play
Minuses: Frame rate is a little low
: Controls take some getting used to

2. Cannon Fodder (Sensible Software/C-West)

Type: Strategy
Good Features: Highly playable
: Cool musical intro
: Better looking than computer versions
Minuses: Graphics aren't very good

3. Theme Park (Bullfrog/Ocean)

Type: Simulatin/Strategy
Good Features: Highly Playable
Bad Features: Scrolling is choppy
: 80 Column text is hard to read on a TV.

4. Val Di'Isiere Skiining & Snow Boarding (Virtual Light Studio/Atari)

Type: Arcade/Sports
Good Features: Fun to play
: Super fast animation
: Good use of color
Minuses: Not as fun as some other Jag games.

5. Syndicate (Bullfrog/Ocean)

Type: Strategy
Good Features: Fun to play
: Highly addictive
Bad Features: Choppy scrolling

6. Troy Aikman Football (Telegames/Williams Electronics)

Type: Sports
Good Features: Terrific AI
: Lots of options
Minuses: Graphics are above 16-bit versions, but not that impressive.

7. Sensible Soccer (Sensible Software/C-West)

Type: Sports
Good Features: Highly Playable
: Captures the feel of Soccer extremely well
Minuses: The sprites are very small

8. Brutal Sports Football (Telegames/Telegames)

Type: Arcade/Sports
Good Features: Fun to play
: Good use of Color
Minuses: Choppy scrolling
: Graphics could be done on 16-bit machines - minus color

9. Wolfenstein 3-D (ID Software/Atari)

Type: 1st person adventure
Good Features: Super fast
: Better looking than Computer and SNES versions
: Lots of fun
Minus: It's old and overplayed.

==========
Fair Games:
==========
1. Dragon: The Bruce Lee Story (Virgin Interactive/Atari)

Type: Martial Arts
Good Features: Some neat combat moves
Bad Features: Looks like a good 16-bit game
: Nothing here that hasn't been done before

2. Zool 2 (Gremlin Software/Atari)

Type: Platform scroller
Good Features: Great use of color
: Appealing characters
: Fast speed
: Kids will love it
Minuses: Not a 64 bit showcase
: Not original

3. Kasumi Ninja (Hand-made software/Atari)

Type: Martial Arts
Good Features: Excellent graphics
: Parental lock-out feature
: Lots of blood
Minuses: Choppy animation
: Difficult to control
: Not as many moves as Mortal Kombat

4. Cybermorph (ATD/Atari)

Type: Adventure/Simulation
Good Features: Good use of polygons
: Highly involving game
: Lots of depth
Minuses: Graphics aren't up to snuff
: The voice of Skylar is annoying!
: Not for everyone

5. Raiden (Imagitec/Atari)

Type: vertically scrolling shoot-em-up
Good features: Good translation of the arcade hit
: Highly playable
: Better graphics than the 16-bit versions
Minuses: Slows down at some points
: Graphics aren't up to snuff

6. Evolution: Dino Dudes (Imatigec/Atari)

Type: Strategy
Good features: Addictive
: Leisurley paced.
Minuses: Graphics are Super NES quality with a little more color

7. Checkered Flag (Rebellion/Atari)

Type: Racing
Good Features: Good use of polygons
: Nice sound
Minuses: Hard to control
: Limited number of tracks.

==========
Poor Games:
==========

1. Trevur McFurr In The Crescent Galaxy (Atari/Atari)

Type: Side-scrolling shooter
Good Features: Excellent graphics
Minues: Repetitive
: Unoriginal
: Choppy at some points

2. Club Drive (Atari/Atari)

Type: Racing/Simulation
Good Features: Fun two-player mode
: Lots of areas to explore
Minuses: Poor control
: Physics is off

: Poor sound effects
: Graphics are weak

3. Bubsy: Adventures In Fractured Furry Tales (Imagitec/Atari)

Type: Platform scroller
Good Features: Big-name liscence
: Long levels
: Better graphics than the 16-bit versions
Minuses: Control is lousy
: Unoriginal

4. Double Dragon V (Williams/Williams)

Type: Martial Arts
Good Features: Big name liscence
: Large sprites
: Better graphics than 16-bit versions
: Lots of moves
Bad Features: Hard to control
: Unoriginal
: Not much above 16-bit games

Hope this helps,

>> Mark <<

The June issue of MacWorld and Mac User should be at the newstand by now.
Front cover shows the 5200.

The Performa 5200 includes software such as ClarisWorks, 8 megs ram, 500 meg
HD, 15' multiscan monitor with swivel, and Quad speed cdrom.

>

Read above.. The LC one ships with the dual speed cdrom(that may change) and
the Performa ones a quad speed one. The LC is intended for k-12.

> I am curious why it was specifically posted to us Atarians, though.

I got the feeling that it was sort of a "fallen comrades in arms" sort of thing... we're all orphans now, no matter what our previous allegiences were (Atari and Amiga owners), and they're trying to do now what the C-Lab and other Atari clone makers have been working toward.

It'll be interesting to see how much success they manage in the MicroSoft/IBM world.. but I do hope we're allowed to read about it in the Amiga newsgroups..

Does anybody know if a version of Word Perfect was ever released for
the Atari.
If it was could you please let me know where I could get hold of a
copy.

Thanks in advance.

: Does anybody know if a version of Word Perfect was ever released for
: the Atari.

"The Atari" is a broad term. It could mean:

The Atari 400/800/XL/XE line
The Atari ST/STe/TT/Falcon030 line
The Atari 2600
The Atari 5200
The Atari 7800
The Atari Lynx
The Atari Jaguar
The Atari Portfolio
The Atari ABC PC line

If you mean the Atari ST line, then yes. Word Perfect 4.1 was
released.

The C-Lab Falcon is _said_ to be expensive, since the suggested retail
price C-Lab gives in their ads is aimed at professional musicians.

>They aren't even Falcon clones
>- just STs with fast processors. Even the A4000/040, although hardly new and
>in need of an update, is still ahead of any commerically available Falcon

In what respect? Sound, perhaps, for neither the Eagle nor the Medusa have
TT/Falcon compatible sound.

>You can also now get
>060/50mHz boards for the A4000 and 64-bit chipset gfx cards which make it
>a considerably more powerful machine than any Atari.

I have yet to see a 060 at all. And what do you think ComputerInsel's
Supernova plus' processor is? It's called 'Mach64', ever heard of it?

>The only real advantage
>of the Falcon is the DSP (which is still relatively poorly supported in
>commercial software).

Yes? Ever seen Cubase Audio 16? Apex Media (ugly GUI, but great software
behind)?

>Oh, and an Escom press release talked about building
>Amigas with 060s in them 'out of the box' as well as possible case

...and vaporware.

> Be sure to let us know when Atari go back into production of computers
>again, eh?

They won't. Atari's OS is portable, so why should they build their own machine? What I expect - if anything - is a PCI sound/midi card for MagicMac/MagicPPC systems, if MultiTOS isn't ported to the PPC itself.

:quantity at any Software etc and EB.

Really? I haven't read anything about people flushing their Jags into the
sewers. And I hope no one is since we don't need the extra water pollution.
Can anyone confirm or refute this claim?

Thanks for the Mac info Mr. Tosspot. As for the Jag info, I think I will
flush THAT down the toilet.

You keep forgetting what Sinclappy means when he says "Jagflop"...

I have no doubt that he flushed his nigh-useless penis down the commode. He
probably has forgotten what it's supposed to be used for and when it fell off
(as things on him, like his brain, are prone to do) and he saw it lying there
in the toilet he thought it was..... oh god, this is getting sick.
I really should get more sleep :)

I'd get hold of a copy of 'Papyrus' instead, for Wp 4.1. is somewhat
outdated and Tempus Word pro is not available in an English version.

Word Perfect released several versions for the ST, v4.1 was the last
version and soon after its release, WP Corp remodeled almost all of
their existing versions to match the look and feel of the ST version,
or so it seems. I have used version 3 on a pc and version 3 on an
ST, and the ST version was more user friendly. I used v4.0 on a pc,
then v.1 on an ST and v4.1 on a peecee and the v4.1 peecee version
looks and tastes like the ST versions.

I> Is there any game like the old "MAJOR MOTION" for my poor PC ?

Do you mean "Major Havoc", the vector based Atari coin-op arcade game..?

I've never seen anything similar for the PC, but there's been a lot of
pressure to get Atari to do a version for the Jaguar video game system.

You never know.. it could happen..!

Well, *someone* must still be making Falcons since C-lab is selling them
in a slightly modified version for use in recording studios.

Why not contact them?

Just a thought...

/Patrik

PS. I agree, Atari shouldn't have been so quick to kill the Falcon. The
software for this machine is looking better for every day. I'm thinking
about highly acclaimed products such as Apex Media and Rainbow II Multi-
media and of course Cubase Audio.

replay 16 sampling cartridge and software (includes sampling, editing, midi assignment of samples, sample examples, and more). the cartridge is a D/A converter. hardly used. the system is new, registered, and fully supported by the manufacturer. this basically turns the st into a midi-controllable sampler. samples can be stored on floppy or hard disk. the program doesn't require a hard drive to run.

one manual, 4 program disks, cartridge, all in original box.

email me if interested, thanks!

No.....he means "Major Motion" - the game for the Atari ST, released
about 1986 by Michtron. The game was an almost-perfect clone of the
Arcade game "Spy Hunter."

I'd think that if you knew half as much about Atari as you purport to,
you'd know this....but then again, it's you who blows his own horn in
here and shies away silent when PROVEN WRONG.

1353. IO Mega Bernouli Drive

Newsgroup: comp.sys.atari.advocacy
Date: 1995-05-16 00:00:00 UTC
From: Steve.Goldfein@1657.gigo.com
Message-ID: <f9b_9505160334@gigo.com>
Source record: 12704

I recently aquired an IO Mega Cartridge Drive system. It appears to be a SCSI Device. [It is also known as a Bernouli Box] Anyway, I would like to use it with my Atari ST and ICD Link. Does anyone know if this combination is possible and if so, how do I go about setting and configuring it? How do I format the cartridges?

Reply either here or email, although email is better.

I don't want to sound fatalist, but lets get real.

Here's an interresting example. NeXT made great computers, with a great OS. Problem is-they couldnt compete in a market locked in two formats (DOS and MAC-as far as 80% of the market exists) so they stopped the hardware drain on their existance, unbundled their software, and darn it all-made a profit.

Atari, has some good games, has a great library of titles-that no one will be playing at this rate since the industry will probably amount to SONY-SEGA-Nintendo. Solution go all out and publish these games on all of the remaining higly channel leverged products and make a mint off of the support of the titles on CD (exception Nintendo) which costs 1 buck to produce and or license (cost unknown) and reap the rewards from having developers support it and have a great library of classic titles. IE make atari a software company and make a profit.

Is this crazy anyone? I think that if we give in to the fact that Atari would be better served in it's video game history in software rather than try to win an uphil fight (get real) license the games and make a mint, and give the real world a taste of something other than MARIO (ack).

can someone forward this to atari?-I don't have a direct address.

thanks in advance, and thanks for your time.

Monty

I have been using Calamus for several years (first 1.09N, then SL), and IMHO it is tops. The font handling and layout control are just great to work with. I publish all sorts of materials, including book length. The thing I do not like, however, is the printing routines of SL. 1.09N printed first time, every time, flawlessly. In fact, it was the first program on any computer I ever used that printed so realiably without my having to fiddle with printer drivers. SL changed all that somehow. Now the program sometimes hangs up during printing, somtimes simply crashes and otherwise makes printing a pain often enough to be a real nuisance. Has anyone else experienced printing problems with SL, and if so have you figured out what to do about them?

Hi Phill,

There is in fact a version released (once on a 'fair' introduced, must be a long time ago because I bought my first mem expansion (512 Kb for plenty cash). I thought it was 4.1. (not wysiwyg, that's why it was not accepted [that's write was better and wysiwyg]. I don't know where to get it, but I will look around, okay?

Rod,

Thanks for listing us in developers list. HOWEVER...

We have moved our web site and I would be grateful if you could update our
entry by modifying our web sites as follows:

change

www.tecnation.com/tecnation/

to

www.tecnation.com

and REMOVE the starbox site listing altogether.

Many thanks.

Finally, from one Brit to another...

I do hope it stops raining here in California, because it's making me homesick!

Alex

Normally I might just ignore such a blatantly rude reply (has petey been taking eloquence lessons from WillBill?) but, what the heck, I'm tired and those who want true intellectual discussion aren't reading this newsgroup right now.

Programming far from takes up all my time. That's why I'm taking a creative writing class, and I've taken several music classes. Next year I'm debating between continuing my music studies or learning Japanese (ooh, anime in the original language!) Of course, I'm always studying keyboard (the musical kind) and learning composing on the side. Really, I spend less time playing games (on any platform) in an average month than the average gamer does in a week.

As for your second question, my girlfriend has no complaints, and yes, she is a living, vocal capable, intelligent human being, unlike ... hm. I'm torn. Should I say "whatever you lust after" or "your mother"?

Silly me. Of course. They're the same aren't they?

Peter, you always say Calamus is no good dtp-program. I remember some time
ago there was the same "discussion" with you and you have only said:
Calamus is bad for dtp, I'm doing dtp for long and so if I'm saying it's
bad, it's really bad.
All questions to you, what's so bad with this program and what is better
withyour favourite program are only answered by: Because I'm saying it.
This is no discussion. You should be able to say what is wrong with Calamus
for you. Only then can other people understand why you are thinking so.
But with that arguments you are stating, nobody can take you seriously.

Yes I have..As for Calmus who cares! Others on the net who have used Calmus, Quark and Pagemaker have stated that Calmus does not measure up.

Plus the Atari line is no longer sold and supported! So is a mute point.

Learn it. As for your point (and a mute one, I might add...) I suppose I
am an intellectual snob when I expect intelligent words from one who claims the
same species as I.

>You must have a lot of time for the usenet. My, my justifying your life. I
>must of bruised your ego.

Well, I spend usually less than 10 hours per week, including reading mail,
WWW and other things, since you ask. "since you ask" I say -- I'm not
justifying anything. I am responding with bits of information called "facts"
to counter your claims. You should learn what facts are.

>Nice try. I imagine that your girlfriend is your left hand or a three hundred
>pound low esteem twat...

Peter: he of the imagination. He also imagines that the Jaguar is dead and
that Apple COmputers is the best thing since the discovery of fire. Do you
really think we give "a tiny piece of turd" (as you call yourself) about
what you dream up in your imaginings. Dearest fantasy, maybe, but then I
guess you probably meant that as a compliment, since your significant other
is the ADB port on your mac.

Actually, I take some of that back. You mentioned Cindy Crawford once as a
standard of beauty, so I guess your standards are even lower than I said.

>Well Sports fan, the Jagflop flopped and bombed. According to Atari's Chief
>Financial Officer 150,000 Jagflops have been sold to date! No opologies needed
>for those who flamed me over the installed base.

Do the Math, idiot. Think about this for a minute.

The last official figures from Atari was 90,000 sold as of June 1994.
The Jaguar was not in Europe yet.

Most sources put the currently installed base of Jaguars in Europe to
around 50,000-60,000. Add the two numbers up, and you get 150,000.

Still don't follow the logic, SinDope? That means the Jaguar has sold 0
(or very very few) systems in the U.S. since June 1994. Is that likely?
NO.

So, what does this mean? The "150,000" number is dated, probably back to
last year. Most other industry analysts have put *todays* figure at around
200,000-300,000.

>Now that Atari is down the tubes, what new line of work can the Tramiels
>pursue?

If Atari goes down the tubes, your life will be OVER! What will you have
to bash if Atari is no longer around? You live this hatred of Atari. You
breathe it. You are fanatical in your hatred of them. You are so
fanatical that you must spend all of your time reading the Atari groups,
scanning for things you can bash.

What a pitiful existence.

Probably Quark Xpress is what comes closest to Calamus, but it lacks
Calamus' inbuilt versatility. It beats the hell out of Pagemaker and
Corel Ventura 5.0 and Calamus' soft ripping is unsurpassed. I'm afraid
it won't be big time on the PC platform though due to poor management;
they're just too late to get a piece of the pie.
Thanks for your useful and intelligent input anyway, Michael, I was
truly impressed.

No douby "everyone" has to do the same for you - in your tiny little
brain, I suppose you believe your messages are of more (or ANY)
significance. Once again, DREAM ON. You're the biggest loser here, as I
have proven, and I shall again.

>
> When are you going to go bother the other Dell owners and leave the Atari
> areas to people with something to contribute besides tripe..?

Why don't you bother the Dell owners? Don't forget to take your
kneepads...the ones you wear around here trying to kiss-up to (or blow)
Atari users.... Obviously, you're starving for some social status and
you think you've found some here. When someone (I) proves you wrong,
your only defense is to maintain the cocky attitude and pretend like you
were never proven wrong....which is what you are doing. Good luck.

When are you going to produce some SUBSTANCE in your replies, bobbie?
Counting message lines? Is that all you can do for a comeback?

Have you no comment on the fact that I've proven you to be an ARROGANT
ASS - that is, I've PROVEN that you are WRONG, and you're still afraid to
admit it? You're still as cocky as before you were proven wrong!!

ISN'T THAT A BETTER COMEBACK THAN COUNTING YOUR MESSAGE LINES?

Try again....

I beg to differ with you, cocky little dumbass. Here's an example of
your own "puerile drivel":

BR>Back when the IBM PC, the Amiga 500 and the Atari 520ST were brand new

BEEP!!! BULLSH*T!!!! None of above were brand new together.
Analysis: puerile drivel from BobR.

BR>Unfortunately you don't seem to even have that much knowledge.
BR>If you knew ANY Atari history, you'd know the Atari ST and the Amiga 500
BR>were released within weeks of each other in 1986.
BR>Thus you got both dates wrong.

BEEP!!! BEEP!!! BobR BULLSH*T detectors going off again!!
After I tried to explain to you that you were in error, you cocked off
again spouting this!
Analysis: more BobR puerile drivel!!!!

Then, after other posters confirmed that you were in error (I was right)
on this issue, you cowardly avoided answering my posts, and only counted
the lines in the messages (afraid of the contents) and called them
"puerile drivel."
Analysis: chicken s*it piece of terd.

ONE MORE THING: WHY DON'T YOU GET YOUR ASS TO THE DELL FORUM IF YOU'RE
GOING TO SPOUT MESSAGES LIKE THIS.... Proof that you're a hypocrite
since you're spouting IBM crap (again), especially after just having told me:

BR>When are you going to go bother the other Dell owners and leave the Atari
BR>areas to people with something to contribute besides tripe..?

Analysis: Certifiable, Undeniable HYPOCRITE!!!!! YES, YOU BOBBIE!!!!!

If it's a SCSI device, it ought to work with the Link on an ST, but...

I don't know if any of the currently available software drivers will work
with it.. in other words, it may hook up OK, but you might not be able
to do anything with it.

It would probably be best to contact ICD and see if they have any experience
with this particular device.

Ah yes... as the little twit reminded me, Major Motion was an early game for the ST from Michtron...

However... unlike the little twit, I have more than puerile drivel to offer the newsgroup.

There IS a very good version of a game like "Major Motion" available for the PC (in answer to the original question).

It's called "Highway Hunter" and is from Epic Megagames.

The game should be on any well-stocked IBM ftp archive site, and it was the "game of the month" recently in the Epic Forum on CompuServe. It can also be obtained from most IBM Shareware dealers.

It's quite good, although not quite as good as Major Motion...

Source record: 12654

Hello,

I'm looking for a small not to expensive computer to "play" with. This means that I will be programming on it (in C and assembler), upgrade and modify the computer (I like soldering fumes) and stuff like that.

I'm considering several options, I could buy an Atari ST, an Amiga or even an old PC (but the limited graphic possibilities almost eliminate this option) I'm not sure if I should consider a Mac.....

Is there anybody out there who can convince me to buy an Atari ?
Is there still enough support for the atari computer's, can I find software for it ? Are there still parts for ST computers ?

Thanks,
Thijs

Ha bloody ha...

Pagemaker is absolute rubbish compared to Calamus SL for
professional design and dtp.

Haven't used Quark but from what I've read I'm not missing
anything.

Coral Draw 3 is also rubbish, compared to the high quality of
Atari compatible programs.

>- Plus the Atari line is no longer sold and supported! So is a mute point.

Ha bloody ha...

If you want an Atari or compatible then you can buy one, if you
want to run superior Atari programs on a PC or a Mac then you
can.

what's your problem.

Same here.

>- Now
>- the program sometimes hangs up during printing, somtimes simply crashes
>- and otherwise makes printing a pain often enough to be a real nuisance.

Actually I've found it very reliable printing from an Atari Mega
ST and Atari TT030 to both the Atari Laser and a Cannon A3 colour
bubblejet. Although it can run out of memory and not appear to do
anything for a while, I can't remember it crashing at all for
absolutely ages if ever.

>- Has anyone else experienced printing problems with SL, and if so have you
>- figured out what to do about them?

What are you printing to (and from)? How much memory have you?

Have you got the latest upgrade - 8.11.94 version. This appears
to have improved printing facilities and drives a Canon BJC800
absolutely brilliantly, which it didn't do until that upgrade.

It's now better than Canon's own driver for MSWindows - though
the problem was the print quality, not crashing.

Wrong. Doug Engelbart invented the mouse in 1964, before Xerox PARC
existed. Which just goes to show that even Xerox built on previous research.

I'm getting tired of reading about people comparing the size of their genitals so I decided that I'd write "Brian's Posting Guidelines".

Rules
-----
1) Obey the mandate of the newgroup that you are posting to. (BTW, the purpose of this newsgroup is to "...attack and defend Atari..." so you may only insult someone if they are an Atari product IN THE LITERAL SENSE)

2) When fallowing-up don't quote the posters entire article. Quote only that which is relevant to your reply.

3) Don't quote other peoples signatures.

4) Limit line width of your post to about 75 characters. That leaves some room when it is quoted and requoted and rerequoted, etc.

5) Don't quote other posts' quotes unless absolutely essential to your point.
--

Brian Quinlan
quinlan@sfu.ca

So it's again the same thing as I stated before. You can't discuss something.
You are only saying: It's bad, I know this and I don't want to give any
argument.
Very good discussion.

: Plus the Atari line is no longer sold and supported! So is a mute point.

Here in Germany the Atari line is sold and supported !

MarkusS

P.S. Peter, why do you quote signatures ? Even you quote your own signature.
This is a waste of time and resource.

As you are in the Netherlands: yep, no problem there.

I, as a TT owner, am considering to buy a Mega STE as a BBS system unit,
the price for these is around 500,- DMs for a complete system in Mausnet,
this includes an SCSI host adaptor (one unit only), an SM 124 or 144/6,
and a small HDD (48-105 megs) usually.

The Mega STE is a 16 MHz 68000 machine with 68881 FPU, VME bus (nice for
graphic cards etc.) and TOS 2.0x, SIMM sockets for a maximum of 4 megs,
and an SCC for fast serial transfers (can also be replaced with an ESCC).

: Yes, exactly, but they are probably made at the same factory as before!

From what I gather this is correct. The thing is if Atari couldn't
find enough work to keep the factory going, how is C-Lab going
to do it?

From what I gather C-Lab is now supervising the running of the Factory, and
if I am also correct this factory ONLY made Atari computers and NOT
the jaguar (which is made by IBM).

The problem is Atari hardware in the USA is outdated and over priced. Starting
next month A PowerMac 6300(in the 630 case) will cost the same as a $1300
and may include a 4x cdrom in the price. This pup makes the Falcon behave like
a turtle, very slow. You will know the meaning of the word slow.

Atari could, but the 'Boys' are pouring the Sega money in a bottomless pit in
their sorry hopes that the Jagflop will succeed. Not gonna happen..

The disadvantage of an integrated keyboard is that you can't type on your lap,
can't adjust to your comforts. As for the disadvantages of integrated
speakers, there is none unless you count quality. You can allways hook up the
5200 to the stereo.

: > Peter, you've long been known for having a selective perception.

: Pot Kettle Black.

The famous phraise Sinclap uses for ducking an argument. Face it
Peter, you love to bash machines that you've never really used. You
ignore the good things said about machines and read only the bad things
said. You're not exactly and objective debater. Calling me an Ataridroid
is idiotic because you are the one that shows continuous bias.

: What about the USA? Will there be PowerPC ST's and at competitive prices?

In the USA there are some Atari dealers left. My point was that
your previous comment was invalid.

Try upgrading your monitor... Personally, I'd rather have an integrated
keyboard than an integrated monitor & speakers. Just for the advantage of
not having a computer that looks like an aborted foetus.

I agree, E-mail would be better suited for this type of flame-war, if any place could be considered "suited" at all for flames. However, I find it interesting that BobR never replies to my E-mail, yet he persists in posting on the newsgroup in a cheesy attempt to "score points" with the Atari community, with which he wants so much to be a idol of. I apologize to all for my constant flaming of him here, but it was only my intentions to counter him on the same turf (the only turf) on which he engaged me. Unfortunately, this newsgroup was it.

Houn-nam, do you accuse me of whining? Sorry, but when someone posts blatant mistruths about computers like BobR, I don't call it whining when I attempt to uncover the error. When I'm attacked for doing so (by BobR) and I reply, I call it a defense. You may call it whining; I call it a damn good defense.

Regarding to world wide sales, if in the rest Europe the Jaguar is
as present as here in Germany and Austria, US sales might be as well
world wide sales.

Jaguars are mainly available from old Atari computer dealers and insider
shops that are specialised in gamnes consoles. In the latter they form a
very small sales share. Virtually none of the big electronic chaines has
Jaguars (AFAIK Quelle is the only company offereing them). Marketing is
none-existing here in Austria and Germany. If England and Holland are not
better off, US sales ARE world wide sales.

: (or very very few) systems in the U.S. since June 1994. Is that likely?
: NO.

: So, what does this mean? The "150,000" number is dated, probably back to
: last year. Most other industry analysts have put *todays* figure at around
: 200,000-300,000.

There is one little problem with what you are saying. The
150,000 figure came *DIRECTLY* from ATARI. Are you arguing
against what ATARI *THEMSELVES SAID*?

While I usually don't get along with Sinclap either, he's
saying something ATARI said!

: >Now that Atari is down the tubes, what new line of work can the Tramiels
: >pursue?

: If Atari goes down the tubes, your life will be OVER! What will you have
: to bash if Atari is no longer around? You live this hatred of Atari. You

Probably Escom... they are going to make Amigas again :-)

: breathe it. You are fanatical in your hatred of them. You are so
: fanatical that you must spend all of your time reading the Atari groups,
: scanning for things you can bash.

: What a pitiful existence.

: /Kevin

: > (If he had any brains would seek new employment, GET OVER IT!)

: If YOU had any brains you would put your SinBabble to rest, GET OVER IT!!!
: /Kevin

Kevin, I hate to say it regarding the Jaguar, but that number
came from ATARI directly.

Source record: 12591

PSDMR> : Same for Calmus..

MR> You've never seen Calamus, so shut up.

Sincrap can't even SPELL Calamus. But then what do you expect from a neolithic preliterate?

PSD> The problem is Atari hardware in the USA is outdated and over priced.

Why does this concern Sinflop so much if he REALLY doesn't like Atari Computers and also claims not to use Atari computers? If he likes Macs as much as he seems to, what does he actually do with them besides quoting price lists and drooling? I seriously doubt if Sinflop even OWNS one of his beloved Macs. If he did he wouldn't have time to post his anal retentive spewings.

MR> Apple has lowered their prices. It's about time.

Wonder why Sincflop thinks that it is such a crushing blow to Atari users that there are fast, cheap Power Macs? Should we break the news to him about MagicMac-which can run Atari programs on a Mac? Or the fact that the same company is working on a PPC version of Magic Mac? It's the software that we are interested in, and personally, I don't care what platform it runs on. If the PPC runs Calamus faster than on a Falcon 030, then it's worth upgrading to eventually. And if there are any Mac/PPC progarams that catch my interest, I can run those too.

... A social life? What board can Sinflop download THAT from?

: Than what did he say? Why would he not quote worldwide?

To surprise the stockholders maybe?

He may have meant
: that 17 are shipping today and the 7 additional ones any day.

Peter, the following Jaguar titles are currently available (not
just "about to ship"):

1. Cybermporph, 2. Trevur McFurr, 3. Raiden, 4. Dino Dudes, 5. Tempest
2000, 6. Wolfenstein 3-D, 7. Aliens Vs. Predator, 9. Doom, 10. Dragon:
The Bruce Lee Story, 11. Iron Soldier, 12. Bubsy, 13. Zool 2, 14. Brutal
Sports Football, 15. Kasumi Ninja, 16. Checkered Flag, 17. Club Drive,
18. Cannon Fodder, 19. Syndicate, 20. Theme Park, 21. Sensible Soccer,
22. Troy Aikman Football, 23. Double Dragon V, 24. Hoverstrike.

Ones scheduled to ship soon include:

1. Rayman, 2. Super Burnout, 3. Ultra Vortex 4. Flashback, 5. Pinball
Fantasies, plus a few others that I can't remember off-hand. At Christmas
of last year, "the 150,000 sales in the US" were thrown around, and
seventeen games were available. The figure is dated.

24 is still low
: considering that 3do has over 200 titles today.

Yes. However, I've heard that only 150 titles are available for
the 3DO and many aren't even games. The 3DO's lineup isn't as great as
you make it out to be.

: You have been chearleeding Atari constantly hoping that Atari will rise to the
: top.

Cheerleeding? Cheerleeding what? I've put up many Anti-Atari
posts. Perhaps you should take a closer look. However, I've also tried to
point out that things aren't as bad as you make them out to be. I have
NEVER ever said or believed that the Jag will be the #1 system. I
happen to like the 3DO and Sega products. Quit spreading such BS.

It ain't gonna happen. The Tramiels have a lousy record and have not
: been able to keep to one date!

There history of datekeeping is lousy, but a few things have been
delivered on time. The Tramiels did make the C64 a huge sucess and sold
millions of ST's in Europe, so I wouldn't say that everything they've
done is a flop.

sinclap2954@cobra.uni.edu wrote:

>- > Pagemaker is absolute rubbish compared to Calamus SL for
>- > professional design and dtp.

>- ST users would disagree with you.

Personally speaking, my primary machine's a TT030, though I also
have a 486 based notebook computer - with Pagemaker 5 on the hard
disk which I've never found a reason to use.

Many 'Atari' owners are not professional designers and have never
used Calamus SL, so their not really in a position to appreciate
it's many virtues.

Calamus SL does things Pagemaker can't. Other things can take
days with Pagemaker but only a few minutes with Calamus SL.
Pagemaker's interface with the user is also primitive when
compared to Calamus SL.

>- > Haven't used Quark but from what I've read I'm not missing
>- > anything.

>- Same for Calmus..

Is your consistent miss spelling of Calamus a pathetic attempt at
a wind-up or are you just stupid?

Either way, _you_ obviously know nothing about Calamus, such as
true WSIWYG - better than any postscript compatible program,
superlative rastering, far more accurate, font technology, and
all at a better price.

>- I wouldn't know..

>- The problem is Atari hardware in the USA is outdated and over priced.

Although Atari owns a few important copyrights which they are
prepared to licence, they are almost irrelevant, at the moment,

I would, finances willing, be interested in a 68040 (or greater)
based MAC to run Calamus SL via MagicMac as I've read it's
blindingly fast compared to my TT or any equivalent Mac program.

>- Starting next month A PowerMac 6300(in the 630 case) will cost the same as a $1300
>- and may include a 4x cdrom in the price.

As Magic Mac doesn't (yet) work with the powermac chips, I'd have
to spend an enormous amount of money buying Quark and other

programs to do the work I do better now. Any saving in the hardware price would be more than eaten up by the overpriced software.

I would also have to consider either getting the Windows NT version of Calamus SL or a PC with Gemulator or Janus to run my current Calamus SL, as an alternative. After all, Mac and Atari compatibles are both niche machines and that, in itself, has certain disadvantages.

>- This pup makes the Falcon behave like
>- a turtle, very slow. You will know the meaning of the word slow.

You should try Coral Draw on a 486 with windows.

I would enjoy owning and could use a falcon, particularly for it's audio-visual capabilities but at the moment it is less of a priority.

I don't quite understand your angle on this one, Markus. In other messages
you have mentioned "professional" use, but said that your output devices
are an Atari Laser and a Canon bubblejet. Hardly professional quality.
PostScript is important to most Pros; Calamus does not have proper PS
support. That is why I think it will be taken seriously by very few
genuine professional people.

: >
: > Not sold, eh? That's why stores in Britain have ads for ST's and
: > software in ST-Format.

: What about the USA? Will there be PowerPC ST's and at competitive prices?

Peter, the USA isn't the whole world. Please try to accept, that prices in
Europe are _very_ different. And again the support is better than in US (if
it's right what you post). A PowerPC version of a "ST" is in development
(as a card for the eagle). And, don't compare the modern Mac's to a ST.
The ST is nearly 10 years old. Compare it to the more modern ones.

MarkusS

P.S. Please don't quote signatures ! You can cut them off if you want to

1449. PORTFOLIO NEWS

Newsgroup: comp.sys.atari.advocacy
Date: 1995-05-23 00:00:00 UTC
From: Jan Sedlak <sedlakj@dec59.ruk.cuni.cz>
Message-ID: <3ps6sg$i94@dec59.ruk.cuni.cz>
Source record: 12600

```
**************************************
* *
* P O R T F O L I O N E W S *
* *
* Internet newsletter for *
* Atari Portfolio users and fans *
* *
**************************************
No 1 April 7, 1995

*******************************************
* Portfolio in the Czech Republic

There is a PF club that provides user services instead of Atari Corp.
or dealers who are dead in this country.

Contact:

Portfolio
252 45 posta ZVOLE
tel: +42 2 99 61 894

INTERNET:
sedlakj@pedf.cuni.cz

************************************
* What is new for Portfolio?

HARDWARE:

- PortWalk - tape recorder interface
Enables to save and load files onto any tape recorder cassettes. It is
very handy, and unlike 8-bit era of "tape recording", this interface
is very reliable thanks to error detecting code.

- 128 KB RAM CARD
Atari cards are very expansive - the RAM card we developed uses one
Low-Low Power chip and CR 2025 lithium battery (plus some diodes).
The assumed life expectancy of the battery at least 2 years.

- 25 pin parallel interface
As there are big problems with Atari dealers in Europe, we decided
to produce 25 pin Centronics (Parallel) Interface. It is a bit
smaller than original interface and consumes twice less energy.

- FolioDrive - 3,5" floppy disk unit with included parallel
interface and battery pack
It was specially developed for Portfolio and enables to read and write
```

1.44 MB PC diskettes. No cables more needed. You can run files directly
from the diskette.

SOFTWARE:

* In February we have finished a graphic version of Portfolio
BIOS and DOS.
This means that Portfolio can display any character using direct
access to the LCD driver. Thus Portfolio can be used in countries
with extended alphabet (e.g. in Czech Republic). We used similar
routines to those used in PGC and PGX format. The resident
program runs even under ROM applications.

* There is a PC program that enables to work with Portfolio .TXT
and .ADR files in the same way as on PF.

OTHERS:

* Genuine leather case with a battery pocket
Protects Portfolio against dust and other "evils". One built-in
pocket for identity card or passport, another pocket
for 3 AA batteries. Full handwork.

****
* Things under development:

- Upgrade your PF to 512 KB RAM!!
We are going to upgrade Portfolios to 512 KB of system RAM

- 60*10 character display
Another aim of ours is to make Portfolio display 60*8 characters using
8*4 pixel fonts. This will mean that user will see more of the whole
screen if running PC files.

We hope to implement other graphic features:
* blinking
* inversion
Portfolio thus will become more PC alike.

There were already some attempts to make soft running in 60*8 mode,
but the new driver will be working constantly with all files.

****
* What we want:

- We are looking for Portfolio users in POLAND, HUNGARY, RUSSIA.
We want to offer them the new BIOS with their characters.

- We are looking for any Portfolio activities in the world.

- We plan to develop following peripherals, provided there are
enough Portfolio users to be interested in them and to buy them:

* new version of FolioDrive 3.5 inch FDD unit
with parallel interface, battery pack

+ internal 128 KB memory chip to serve as CASH and B: disk.

* FAX-MODEM module to send and receive fax, modem messages every where
in the world

* cordless, radio-wave based interface to connect PF to PC

* 512 KB or 768 KB SRAM module to serve as a data storage medium

* Interface for PCMCIA cards

****
* What we are looking for:

- any PF fans that want to join us

- any PF users who are able to develop new soft

- information about: Re:Port, Portfolio Connection Newsletter, etc.

- any kind of emotional, mental and other support

- any dealer that is willing to go on with
PF stuff and wants to sell our products

****
* How to get the described things

We hope that TOAD COMPUTERS will distribute
all our products in the USA and Canada.

Please support our efforts in promoting Portfolio
and send them your request for PF and products

Their e-mail: toad@charm.net

Otherwise send e-mail to us:

sedlakj@pedf.cuni.cz

****
Special greetings to:

Don Messerli - for his soft and graphics
BJ Gleason - for PBASIC and tons of other things
S. Spoelstra - for his BASIC, and others
Tomas Dusek - Go on developing the hardware!
Martin & Milan Hrdlicka - the authors of new graphic BIOS

How do you output 2560 dpi to your Canon bubblejet, then?

There are about one or two bureaux in the UK that can handle Calamus,
hundreds that will do PostScript.

If you have had problems with PostScript, it may be down to problems
with the actual application, rather than the language itself of course.

> Why don't you guys take personnal attack to you e-mail, no one is
> interesting in hearing your whinning around here.

No thanks... I already have James Woods' garbage filling my e-mail, which I delete unread as soon as it appears.

If you read my replies, there are usually no personal attacks contained in them, only observations about how much of people's time and bandwidth he's wasting by continuing his juvenile ranting.

(I don't consider "juvenile ranting" to be a personal attack, more of an accurate description.)

You might want to consider asking James to find a more appropriate newsgroup to vent in, unless he can come up with something useful in an Atari group.

> How about the both of you shut up? Didn't you raise a big stink a
> few months ago when Peter and I got into a debate? You are doing the exact
> same thing with James.

Not at all. My criticism of the exchange between Mark and Peter concerned the content of the messages.. a juvenile playground comparison of everyone's penises.. as if that was in any way appropriate in a computer newsgroup.

The only puerile obscenities and incessant vituperation I've seen here has been from James. I have no problem posting answers to questions and passing on information direct from Atari Corp... it's too bad James can only vent.

My replies have only been pointing out how much of my time, your time, and everyone elses' time he's wasting with his uninteresting drivel.

He's already told us he's done with Atari and has bought a Dell PC.. why not invite him to join other PC users in the appropriate newsgroup, and leave the people who still use Atari computers alone..?

> I'm considering several options, I could buy an Atari ST,

The ST is a good machine to program on.. there are several choices of
C compilers to choose from, both PD and commercial (the latter mostly only
available used from other owners now though.)

The system is easy to work with and is reasonably fast for development work.

If you do decide to get an ST, look for either a 1040 STe <--note the "e",
or a Mega Ste model. These are easy to upgrade and come with newer versions
of TOS, the built-in operating system. 1040 STes are fairly inexpensive,
while the Mega STe with its built-in hard drive and 16Mhz "clock doubler"
speed will be somewhat more expensive, but also somewhat nicer.

The down side is that Atari is no longer producing any model of its computers,
so support is very difficult to find from "official" sources.

Many software packages (including programming applications) are no longer
being updated or can be difficult to find. Support is probably greatest
in Germany, so you may be luckier there than those of us in the US, as you
can probably obtain German magazines and third-party products in the NL.

The newest Atari computer model is the Falcon030, which is also no longer
being manufactured by Atari. There are still new ones available in the
"pipeline", but when those run out, there will be no more from Atari. The
Falcon has been licensed by C-Lab in Germany, and they will be producing
them for the music market mainly.

The Falcon is not a very cost effective choice, unless your application
happens to be one that it excells at. Digital music seems to be the
main reason to use a Falcon currently. C-Lab has said they hope to be
able to reduce the cost when their agreement with Atari allows them to.

A 1040 STe would be a good "fun" machine to choose, as long as you're aware
of the situation, and don't expect much in the way of support.

> or even an old PC (but the limited graphic possibilities almost eliminate
> this option)

Depends on how old you're talking about. Even an XT class machine can use
an 8-bit VGA graphics card... I'd be more concerned about the speed of
the system, depending on what you want to do with it. Also, the cost of
putting together a fairly capable modern system is not all that bad, so
you might not have to even look for an "old" one. A motherboard and case
are pretty cheap these days, and hard drives and addin cards are cheap too.
If you enjoy solder fumes, you would probably also enjoy assembling your
own computer from pieces and parts.

Costwise though, a used 1040STe would probably still be your best bet.. watch the "for sale" ads on local BBSs to see if you can pick one up. The NL used to have a lot of Atari activity going on, so you might be able to find someone selling out near you. Also, there are usually a lot of For Sale ads in the comp.sys.atari.st newsgroup, although you'd likely have to pay a pretty hefty shipping charge for most of them.

> From what I gather C-Lab is now supervising the running of the Factory, and
> if I am also correct this factory ONLY made Atari computers and NOT the
> jaguar (which is made by IBM).

I've read this same kind of thing myself, which is actually a bit confusing, since Atari sold off all its manufacturing facilities several years ago.

My understanding had been that they were using "On Demand" manufacturers to produce runs of computers when they needed them, but that they no longer owned "The Factory" themselves.

Another report indicated that what C-Lab licensed was the technology and the masters for the printed circuit boards as well as the firmware that goes into the computer. The C-Lab Falcon II may indeed be produced in the same factories that made the Atari version simply by virtue of those factories already being set up, or at least being familiar with the system.

I'll see if I can remember to ask Laury Scott, the VP of manufacturing for Atari and see if he can tell us what's up.

THE KEY TO ORGANIZING YOUR HEALTH RECORDS

"If you care about yourself and your children, you will do everything you can to know your family's medical history. It can save your life, and the lives of those who are dear to you." -- Dr. Aubry Milunsky, Director, Boston University's Center for Human Genetics (Life Magazine, March, 1995).

Your Lifetime Health Planner offers the simplest, most effective way to take charge of your health. Enter important facts about your health history, keep a record of the names of medications and their effects, document each doctor visit and diagnosis. You will have the information you need, and in the event of an emergency, so will your family.

Your Lifetime Health Planner, 198 pages in a compact, loose-leaf binder, contains a variety of sections which include "Doctor Visits," "Medications," "Family Health History," and "Doctors and Specialists." The Planner is a must for the busy executive who needs to stay organized, for seniors who are receiving care and for newborns who need a record of their health care.

Parents Magazine recommended the Planner to its readers (April, 1994) and MCI called it "a useful resource in managing your personal health records." Margie Smotherman, Coordinator, Employee Health and Wellness, Blue Shield/Blue Cross of Iowa, said: "The employees felt that these (Planners) were great tools to not only record their pertinent numbers, but to plan for doctor's visits."

To get your copy, send a check or money order for $19.95 (plus shipping and handling) to :

Actually, I should have added a "do" after the "I". That was more the intent
of my phrasing than replacing the "I" with "me"

And, as I mentioned, the "mute" point was making fun of floppy pete.

Lastly, let me say that I do not claim "intellectual superiority" -- As I said,
I expect intelligent words from those claiming the same species as I do (see,
that's the better phrasing, though the original is still correct when viewed
from this point of view) If sinflop cannot excrete coherent thought, then yes,
I do consider myself superior to him. But hey, compared to sasquatch-boy,
peat moss claims intellectual superiority.

That's wrong - you can run SL on an plain ST, and if it's anything like
as fast as Calamus 1.09n, then it's faster than most windows based DTP
packages even on an 8MHz ST (I used to use it all the time on my ST
before I got a f030).

Now we are coming to the core of Peter's problem. We are talking of
"Calamus", while he speaks of some obscure package called "Calmus".

Plus he introduced hearsay as "proof" for his claims.

>- I don't quite understand your angle on this one, Markus. In other messages
>- you have mentioned "professional" use, but said that your output devices
>- are an Atari Laser and a Canon bubblejet.

I think you are actually refering to me.

I was replying to someone who was having problems printing out to
their 'in-house' (and unspecified) printer from Calamus. I was
just replying that I didn't have similar problems.

>- Hardly professional quality.

For what?

The Atari laser is amazingly fast compared to an awful lot of
lasers and excellent for proofing purposes. One way or another it
has often been used as camera ready artwork, not just for
'stationery' but also for things like colour record covers &
colour T-shirts. With the freely available Ghostscript it becomes
'postscript compatible'

Yes it is now showing it's age and I'm considering what to
replace it with. A 600 dpi +RET Hewlett Packard or a 1200 dpi
Lexmark seem competitively priced and have attracted my interest
as hopefully I would then need to use a bureaux even less.

The Canon inkjet is great for small volume 'custom' jobs and is
also useful for proofing colour work at A3 with 16 million
colours, if required. With Ghostscript it also becomes
'postscript compatible'.

>- PostScript is important to most Pros;

It really depends on what they do. I wouldn't deny that it is
somewhat dominant and in the UK there is not much demand for
Calamus operators. However for those that need their 'own' system
Calamus is a perfectly viable option . I've even got work
competing against Mac and PC users.

Although there are a lot more postscript bureaux I haven't found
it a problem in the UK. CY Services are extremely friendly, very
helpful and I don't even have to leave the building. I just modem
the file to them and if the timings right, get the 'bromides' in
the post the next morning - without all the problems I read about
from postscript users.

I recently compared the price with other postscript places and found out that Calamus bromides were cheaper. This is possibly because equivalent imagesetting equipment for Calamus was about half the price of postscript compatible equipment when I last looked or maybe just that CY give better value for money.

>- Calamus does not have proper PS support.

I don't know as I've never used the appropriate module, although I gather it has recently been upgraded and significantly enhanced. ATM fonts can be converted to the reputedly more accurate Calamus format with the inexpensive 'Fonty'.

>- That is why I think it will be taken seriously by very few
>- genuine professional people.

Well if DMC in general and JCA in the UK got their collective fingers out I think it is possible for Calamus to have a larger share of the market. However, they have their own ideas and aren't interested in mine.

> penises.. as if that was in any way appropriate in a computer newsgroup.

You just wanted to flame in a war that had nothing to do with you and try to
come out on top. Like you're doing here. Period.

>
> The only puerile obscenities and incessant vituperation I've seen here has
> been from James. I have no problem posting answers to questions and passing
> on information direct from Atari Corp... it's too bad James can only vent.

You just say that because you're pissed off that I won't let you win this
one. WRONG. As I've indicated so many times before, you are the one who
claimed the PC (1981), ST (1985), and Amiga 500 (1986?) were released the
same year. You've also been wrong on other accounts. When I attempted
to correct you, you took offense and told me stuff about "If I knew
anything at all about Atari", "If I could read", "You twit"

If you think that words like "puerile" and "vituperation" make you look
intelligent, think again. Your claims are very hypocritical, no matter
what vocabulary you try to use to make yourself look sophisticated.
Those words are laughable coming from a hypocritical flame-war meister
like yourself. If "it's too bad James can only vent", then
what are you doing as you accuse me of "puerile ovscenties and incessant

vituperation?" Looks like your venting in hypocrisy pretty well.

> My replies have only been pointing out how much of my time, your time, and
> everyone elses' time he's wasting with his uninteresting drivel.

Concern yourself with YOUR time and YOUR arguements. Don't attempt to
pull others to your one-man "badwagon" with claims of "their time" which
you've wasted in equal proportion, incidentally.
You've also avoided commenting on everything you've posted that has been
WRONG, yet you've BEEN AN EQUAL PARTNER IN THE FLAME WAR, or I wouldn't have
your message to reply to as I type this now. Just another example of the
hypocrisy.

I'll admit I've been an avid partner in this flame war, but I contend
that you are just as guilty. Furthermore, I submit that because you are
equally guilty, yet accuse me of wasting time/drivel, that you are a
class-A hypocrite. It's almost as if you're unaware of your actions. Do
you not recall calling me a "twit?" Do you not recall telling me to find
someone to read your messages to me? Do you not recall telling me that
I know nothing about Atari, after you claimed that the IBM PC, ST, and
Amiga 500 were all realeased at the same time? What a memory you must have.

>
> He's already told us he's done with Atari and has bought a Dell PC.. why
> not invite him to join other PC users in the appropriate newsgroup, and
> leave the people who still use Atari computers alone..?

JUST ONE MORE EXAMPLE of a big, fat, nasty, blaring BobR **L I E** !!!!!

I do not have a Dell PC. Where did you get this information? I am not
"done with Atari." Where do you get this information? There must be 7
or 8 Atari computers in my downstairs.... What kind of dumbass tells me
I'm done with Atari computers without searching my house first?

'nuff said.

James

1470. END FLAMES; READ THIS FIRST!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-05-24 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950524170107.3572F-100000@PEAK.ORG>
Source record: 12621

Ok - first, I'll admit that I fanned the flames one more time, just prior to posting this message. That's the bad news. I couldnt' help it - BobR said stuff SO WRONG....like playing innocent in the flame war while he was an equal participant.....stuff like "James got a Dell PC and is done with Atari" when I don't have a Dell at all, and I have about 8 Ataris in my basement. I could go on, but I won't.

Now the good news - I won't reply to Bob's posts at all. I've decided to just drop it - and rather than fan the flames, I'll just punctuate my postings with a little signature file that will accurately prove my point. No, I won't call names... I'll just use direct quotes.

Sorry to all; I've been an equal participant in this flame war, and unlike BobR who maintains innocence, I admit guilt. How anyone who has stirred it up as much as he has can maintain innocence must take powers of denial to a new plateu.

James.

"Back when the IBM PC, the Amiga 500, and the Atari 520ST were brand new..."
"If you knew ANY Atari history, you'd know the Atari ST and the Amiga 500 were released within weeks of each other in 1986."

1471. GEMulator

Newsgroup: comp.sys.atari.advocacy
Date: 1995-05-24 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950524172143.3572G-100000@PEAK.ORG>
Source record: 12622

Anybody out there been thinking of/using the Gemulator?
I figure since it's a "virtual Atari", let's advocate it here.

I just received the Branch Always newsletter, and frankly, I am VERY
IMPRESSED with the product announcement for the GEMulator.
Take a look at what this announcement sez:

* Run ST, STe, Mega ST, Mega STe on the Windows desktop, side-by-side
with MS-DOS and Windows programs.

* Support for all TOS versions (1.00, 1.02, 1.04, 1.06, 1.62, 2.05, 2.06)

* Emulation of memory sizes from 512K to 14 megabytes. (If I understand this
flier correctly, a PC with only 8MB of memory can emulate a full 14MB
of memory by using virtual memory!!!)

* CD-ROM support for Atari and PC CD-ROMs with no additional Atari CD-ROM
drivers required!

* Unlimited hard disk access - access ANY file oon ANY disk partitionn on
your PC, inc. >32MB, Stacker/DriveSpace, - put the /AUTO? folder directly
on your PC's C: drive!! Share documents between Atari/PC programs, and
no Atari hard disk drivers are required anymore!

* Unlimited screen size - GEM desktop can grow as large as your Windows
desktop - up to 1600 x 1200 in mono and color; limited by your hardware.

* Multiple modem and printer support - Atari programs can access any printer
or modem that Windows supports; switch between on the fly. Go beyond
19,200 to 28800, 38400, 115200 baud.

* Stereo sound and MIDI - if your PC has a stereo sound card and/or MIDI
card supported by Windows, you can use it with your Atari software!

* Blitter chip emulation - With version Gemulator 4.0. Turn it on/off like
a real Mega STe, as well as built-in "Quick ST" emulation. NVDI 3.0 and
warp 9 fully supported.

* Joystick support - use PC joysticks to emulate ST joysticks

---

Holy cats. That's unbelieveable. Anybody experienced with this product?
Anybody know what percentage of games will run with it?

According to the product announcement, a 486 DX/33 will emulate about the
full speed of a ST/STe, and a DX2/66 at the same speed as a Mega STe. A
60Mhz Pentium will emulates at the full-speed of a Falcon, and a Pentium
90 emulates at the full-speed of a 32Mhz TT!

What I find most intriguing is this:

"You hate File Manager? Use the Atari's desktop to copy, delete, and
even run your DOS and Windows programs directly."

Amazing!!! Running GEM on the PC - to run PC programs!! Heh...I'd get a
kick out of that.

WHO IS USING THIS PRODUCT NOW? WHO PLANS ON IT? WHO HAS USED OLDER
VERSIONS OF GEMULATOR???

James

Back to counting message lines in an attempt to avoid the substance in which they deal, eh Bobbie? I've noticed that any message that DEMONSTRATES (with YOUR OWN QUOTES) what a liar, misinformant, and hypocrite you are NEVER GETS ADDRESSED, but you count the lines of text and use that as the basis for your retort. Fantastic strategy, but quite tacky.

> We're so lucky you're here to waste our bandwidth.

Here you go starting the "one man BobR bandwagon" again, trying with all your heart to PLAY INNOCENT in this matter. Face it Bobbie; you're an accomplished flamewar participant foremost, and a hypocrite, liar, and misinformant after that.

> Too bad you have nothing of substance to offer the Atari newsgroups.

Thank you for your opinion. However, the vast majority of your messages suck pretty hard, too....especially when you think that 1981 is the same as 1986...ha ha ha! That's an eternity in this industry, bucko. Shows what you know, and the "substance" of your messages in proper context. And I quote:

BobR>Back when the IBM PC, the Amiga 500 and the Atari 520ST were brand
BobR>new, the........

BobR>If you knew ANY Atari history, you'd know the Atari ST and the Amiga 500
BobR>were released within weeks of each other in 1986.

Ouch! The truth smarts, doesn't it, Bobbie???

From the latest PowerPC Newsletter:

==========
ESCOM PLANNING POWERPC AMIGA NEXT YEAR; PONDERING OTHER OS's
(May 23rd 1995) Escom AG, the Heppenheim, Germany-based computer manufacturer and retailer that has bought Commodore's technology and rights will produce a PowerPC-based machine next year. The company is also planning to support other operating systems including Windows NT, OS/2 and Mac OS.

The company will lay out its full technical plans for the Amiga next week, however on the face of it, it looks as if the company will produce a version of the Amiga based on the new PowerPC Hardware Reference Platform, which would let it run the foreign OS's without too much trouble.

The corollary of this is that, going with the HRP hardware platform would let the company license its operating system out to other PowerPC-based manufacturers. An Escom spokesman said the company intended that the licensing policy would be "as open as possible", though could not give details, as we went to press.

The company is focusing its efforts on retaining and growing the Amiga's traditional multimedia base. Production of the Amiga models 4000, 1200 and 600 will be restarted. Even the trusty Commodore 64 will be dragged out of retirement to server the East European market.

Before the PowerPC machines appear, the company intends to bolster
its top end with a machine based on the Motorola 68060 processor.

The company also intends to push Amiga technology into the set-top
box arena and is talking of a PC-add in card that will let PC-users
run Amiga applications.

In what way? The PowerPC blows away the 630 when running native apps..I know my brother has a 630 with the PPC card..

> 22. Troy Aikman Football, 23. Double Dragon V, 24. Hoverstrike.

Let me clarify it. Someone else clarified it. Atari's CFO figure was
based on the Atari label titles that are shipping which is 17. he was not
counting third party ones.

>
> Ones scheduled to ship soon include:
>
> 1. Rayman, 2. Super Burnout, 3. Ultra Vortex 4. Flashback, 5. Pinball

15' are standard. If you need a larger one, you can ad a larger one to the 5200
or you can purchase the other models that do not have a integrated one. Think
about it.. You have choices..

Source record: 12491

: I can't believe everyone is flaming PSD (ok, I can believe that) about
: his claim there are only 17 games for the Jaguar with cries of 'but there
: are 22 whole games!'.

Actually there are 24. :-). However, there are about 100 in
development, some very close to release, so it's not like the Jag library
will stop here.

: This was all pointed out at the time of the launch. 'Remember the Lynx,
: the ST, the 5200, the 7800, the way Atari let the 8-bits die?' but of course
: the line you Atari advocates were pushing was 'Atari will get it right this
: time'. Yeah, right.

Atari is doing many things right this time. The problem is that
Atari's small and will not dominate because it's so small. What Atari did
do right with the Jag:

- Increased advertising. Atari spent $300,000 on pushing the 7800
for it's entire run. Atari spent $11 million on Jaguar ads for the
pre-christmas quarter.

- Getting 3rd party support. The Lynx had 3 developers
(shadowsoft, beyond games and telegames), and so did the 7800
(Activision, Absolute Entertainment and Froggo Games). The Jaguar has
hundreds of developers. Even if only 1/4 are actively working on games
right now, that's still a big step up. So far, there have been releases
from Virgin, Williams, ID, Ocean, C-West, and Telegames. No ... it's not
great, but it is a big step up.

- Dealer support improvement. I never saw any promotions for the
Lynx or 7800. I've seen numerous Jag kiosks, banners and promo items in
stores. Atari's reps have gone out to stores to help promote the Jag.
There are dealer tapes. No ... not perfect, but a big step up.

My point: cut Atari some slack. No, they aren't going to
dominate, but saying they aren't putting an effort into the Jag (and
learning from their mistakes) is total hogwash. You can't go from 0 to
100% overnight. I think Atari is doing a commendable job of improving.

Atari has let down/burned their customers so many times that I
wonder if it wouldn't have been wiser for them to start with a new name
on the Jaguar - make up some new divsion of the company and market the
Jag under it. There are so many negative connotations to the name of
"Atari" now, with all the years of vaporware, leaving users high&dry, and
I even remember reading magazine articles from major retailers like Sears
Roebuck who'd claimed to have been "burned" by Atari and vowed not to
carry thier products again.

>
> This was all pointed out at the time of the launch. 'Remember the Lynx,
> the ST, the 5200, the 7800, the way Atari let the 8-bits die?' but of course
> the line you Atari advocates were pushing was 'Atari will get it right this

I think the 5200 was doomed from its very conception, and the "XE
Game System" should have been released WAAAAAY back then instead of 1987
or 1989 (or whenever they released it). However, the 5200 was the "old"
(Warner) Atari's mistake.

The 7800 was Tramiel's screw-up. Perhaps it was because Atari
had just emerged from the great crash of '84 that Tramiels figured the
video game fad was over.....but didn't they let that 7800 die? All the
while Nintendo could see the light, the 7800 could have (with the right
software and marketing, and it's 2600 backward compatibility) been the
machine of choice in that generation. I distinctly remember **WATCHING**
friends and neighbors REPLACE their aging 2600s with the original
Nintendo. God - can you imagine what advantage of "incumbency" the
backward-2600 compatibility would have given them - plus
Nintendo-quality games to boot? As much as I've been
into Atari, I NEVER NEVER heard of the 7800 until logging on some Atari
BBS, and nobody I knew (who wasn't an Atari-specific freak) even knew it
existed. To date, I've never even seen a 7800, and I've looked.

> Now a year and a half down the line Atari don't make your computer anymore

> of hundred thousand. You might like to reflect on that when you try to
> defend the only company that could give Commodore a run for its money in the
> incompetance stakes......

I just don't get it about the Jaguar games. I like the Jag, and played Alien vs Predator & think it's great. However, for MONTHS AND MONTHS it's constantly been a story of "hundreds of vendors have signed on and are about to release games." I mean, this has been the story since the beginning of the school year (Sept) and now it's time for summer and still only a few games!! What's up?

Same thing with the Jag CD player. Where the hell is it? Why isn't it shipping? What's up with that? As far as I'm concerned, until a product is ON THE SHELVES at the dealer and WITH A PRICE TAG, it is vaporware. There's a HUGE electronics "supermarket" called "Future Shop" (I think it is a Canadian company expanded to the U.S.) and they have the most impressive Jag display I've seen - 2 kiosks, total of 3 demos machines (1 on a big-screen TV), a wall of Jag games (wish there were more), etc. I keep looking for the CD player and I don't see it. Thus far, as soon as I read about a new Jag product in the mags they have it in stock. I can only assume that the Jag CD is not shipping. Too bad.

James

: Atari has let down/burned their customers so many times that I
: wonder if it wouldn't have been wiser for them to start with a new name
: on the Jaguar - make up some new divsion of the company and market the
: Jag under it. There are so many negative connotations to the name of
: "Atari" now, with all the years of vaporware, leaving users high&dry, and
: I even remember reading magazine articles from major retailers like Sears
: Roebuck who'd claimed to have been "burned" by Atari and vowed not to
: carry thier products again.

If the Jag goes nowhere, I could actually see that happening.
Apparently Atari is going to enter the PC CD-ROM market under a different
name. Other things could sprout out of this.

As for a 7800 - check the net. People are always buying and
selling. They're becoming a collector's item. I have one and think it's a
great machine. Not up to standards with the SNES or Genesis obviously,
but it certainly dispels any myths that all Atari game systems feature
crude, block-like 2600 graphics. When it was still being produced, I
remember it being sold in K-Mart, Zaires, Toys R' Us, Kay-Bee,
Child-World and quite a few other places. It seemed to have better
distribution is chains than the Jaguar, though the Jag actually seems to
have more space in video-game specific shops.

Petey Sinclair,

I no longer have to look for a new Mac for my sister.
My uncle is selling his 2-month-old PowerBook 520 to her.
I don't like portables since they usually have suspect
screens and are ALWAYS a year behind the desktop units,
but for her needs it should do just fine (though she will
probably be forced to upgrade it to a PPC chip sometime
in the future). She is also getting an inkjet (your
favorite kind of printing device) in the deal.

Why is my uncle selling his brand-new Mac portable to my
sister? Because he is switching to the *PC platform*!
He will replace his Macs with a Pentium-based machine
that I will pick out for him.

Why is my uncle switching to the PC platform, even though
he prefers Macs to PCs and has been a loyal and happy Mac
user for nearly a decade? Because the software he needs
only runs on Windows, that's why! He is a lawyer, and the
vast bulk of the legal software made is available on the
PC only; no Mac versions. In other words, he is switching
because the Mac no longer suits his needs.

Looks like the Mac has *flopped* as far as the legal
profession goes. GET OVER IT!!

* Tom

|>

Children......

Of course, Peter knows what a Vagina is for - he's studied all the relevant texts (Men Only, Parklane, Shaven Ravers). He's got the theory down to pat, (slap slap slap - evenings in with Pam), and hopes to put it into practise one day.

There's nothing wrong with working in your hobby, it just makes the work easier. I used to work in electronics (MMS Space Systems, Comms Sats) but I've just moved over to software 'coz it's easier and the money is better (much better - about 40% better).

I don't think I'm sad....others may disagree - but hey, PSD is an example of american youth so we do have to bear with him until he matures (about the age of 35).

|> "Peter Sinclair, you are a tosspot; you are a wanker; you are a very tiny piece

|> - Atari's Jeff Minter
|> (If he had any brains would seek new employment, GET OVER IT!)

Notice that Peter quotes Jeff in his sig - it's his claim to fame, someone famous and respected the world over, once called him a tosspot. Not what I'd put in my .sig ..... now if Jeff were to post saying 'Craig Graham, you are cool as fuck, may all your trips be wonderful, nice one...' then perhaps I would quote that :) - but tosspot? The mind boggles, it really does.

Craig.

1495. Jaguar - wow! 22 games!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-05-26 00:00:00 UTC
From: b2004@vsprsun_14
Message-ID: <1995May26.103321.1159@queens-belfast.ac.uk>
Source record: 12635

I can't believe everyone is flaming PSD (ok, I can believe that) about his claim there are only 17 games for the Jaguar with cries of 'but there are 22 whole games!'. I mean, if the people who had manufactured my computer dropped it in favour of a games console, and then a year and a half after release there were only 22 games out for it (many of them crap) I'd keep quiet about it.

Sorry folks, 22 games are nothing to shout about, it only proves that the Jaguar has pretty much sunk up to its neck in the doo-doo. Not because its crap (its actually very powerful and for a time was _the_ most advanced system) but because Atari have done whats known in the business as an 'Atari' on it.

This was all pointed out at the time of the launch. 'Remember the Lynx, the ST, the 5200, the 7800, the way Atari let the 8-bits die?' but of course the line you Atari advocates were pushing was 'Atari will get it right this time'. Yeah, right.

Now a year and a half down the line Atari don't make your computer anymore and the much vaunted saviour has only 22 games for it and sales of a couple of hundred thousand. You might like to reflect on that when you try to defend the only company that could give Commodore a run for its money in the incompetance stakes......

Try to align object together, let say I want a picture to be exactly in
the middle of a circle that is twice the size of it. Oh I fogot, you just
heart it from someone how Page Maker is good and never actually seen or
used it.

: Over price software? If it's so over priced, why is Calamus irrelevant?

: PageMaker 5.- costs $199.

That's for you students. Try to buy in a regalar store it's about $500 and
not everybody is a student. Plus when you buy it from a school their is
no support from Aldus. I've been there. For someone that is using Page
Maker, Calamus 1.09, Calamus SL and Page Stream, let me tell you this
Page Maker 5.0 is not even close to Page Stream 2.2 which dated back to 1992.
Speaking of Calamus is irrelevant because people like you don't know what
is a choice out there and be like a sheep and follow whatever is trendy.

MagiCMac/PPC will be in emulation mode mostly, at least in the beginning,
that's why. Plus, Atari apps that aren't recompiled will also run in 68K
emulation mode.

The major drawback of 1st generation PPCs by Apple is the lack of
standard interfaces (PCI, RS232, Centronics, etc.).

So you accept that Calamus does things Pagemaker can't?

For examples read the appropriate newsgroups over a period. On
the other hand as you seem not to know anything about Calamus I
suppose it wouldn't help.

>- > Is your consistent miss spelling of Calamus a pathetic attempt at

Speaking of laser printer prices, I see that there is another low-end laser approaching the "under $300" range...

The Okidata OL400E has recently been priced as low as $319, and can be easily hooked up to an Atari system for good, low cost output for everyday use.

>>The word is "moot", not "mute"... Learn it.

> That was lesson #1. I was making fun of him when I used it.

I was hoping that was what you were doing.. (my newsreader reads articles
in reverse order.. gak.. so I saw your first message after replying to
this one.)

A certain Ms.Sysop uses the term "should of", as in "I should of never done.."

Used to drive me nuts too... (to, two..)
:)

> Sorry Bob, but I never said any such thing, and I resent you slandering me
> in such a way.

I thought I remembered you being part of the "discussion" I read when I first rejoined this newsgroup... I apologize if I was wrong about that.

> I was against Peter's debating skills and the fact that he couldn't back up
> any of his flames with proof and ignored many arguments I made, in favour
> of his circular, close-minded view.

I remember this now, and again.. sorry I mixed up that discussion with the others.. it's hard to keep the flamewars straight sometimes.

> My criticism of you is on your personal attacks on James and vica versa.

Really my only "personal attack" on James has been to call him a "twit"... and since he fits the dictionary definition of the word, I doubt it's even a true "personal attack" in the sense of his unceasing spew.

I also called him a liar, supported by the fact that he replies selectively to messages he says he's received, while he says he hasn't seen other messages. I find it beyond the parameters of "reasonable doubt" that the Internet is so selective in losing messages.

He has in fact, publically stated that he ignores messages or parts of them because he enjoys "pissing contests". He's also stated that he feels he can ignore the charter of a newsgroup and post anything he feels like, regardless of its appropriateness for the newsgroup. Lastly, he's publicly posted private e-mail, in violation of all "netiquette", and then wonders why I won't respond to his e-mail.

(Refer back to the dictionary definition I mentioned earlier.)

The informational content of his messages has been effectively ZERO, either in the sense of conveying actual information about Atari, or even in the sense of supporting the Atari platform in an argumentative discussion of the merits of the platform, as the charter of the newsgroup mandates, for months now.

On the other hand Mark, your messages DO convey information, help for other members of the group and a sense of support for the platform. Again, I apologize if it ever appeared that I group your postings with anything James has ever "offered" us.

What you've seen from me has been (and I reserve this right) generalized replies to his spew. I don't plan to waste my time (or yours) replying to him on a point-by-point basis, as that would be pointless.

I hope you can see that there's a considerable difference between my replies to him and his messages.

At any rate, he's already posted his "I'm not Atari bashing, but Atari is dead, and here's why" essay, and bought a Dell PC computer, so hopefully he'll find another Dell owner in a PC newsgroup to "piss with" and leave the Atari areas alone.

>but for her needs it should do just fine (though she will
>probably be forced to upgrade it to a PPC chip sometime
>in the future). She is also getting an inkjet (your
>favorite kind of printing device) in the deal.

I don't think that being "forced" to upgrade to a PPC chip
is such a bad thing. In fact, if Atari said "OK, we're done
with the 68K series. You'll have to upgrade to our new
180MHz 604 chips." a lot of Atari users would be happy (if
they beleived Atari was committed).

>he prefers Macs to PCs and has been a loyal and happy Mac

>PC only; no Mac versions. In other words, he is switching
>because the Mac no longer suits his needs.

That's exactly why you should switch platforms; because the
old one didn't suits your needs. The same could be said for
the Atari. There is a lot of PC/Mac software that is not
available for the Atari.

Peter,

Could you PLEASE learn how to use your text editor properly. There is
absolutely no need to quote entire previous posts including sigs in your
replies.

Not only is it a total waste of bandwidth, it is also a waste of time and
money for everyone (except the phone companies and Internet providers) for
having to download the same message twice, especially if you have to call
long distance for Internet access.

The above quote is what your reply to Mark Rathwell should have looked
like. Please be more considerate of others.

Thanks,
Brad

Wow.. a big one this time, eh James..? 88 lines of spew...

I'll ignore most of it, giving it the attention it deserves.. however..

> As I've indicated so many times before, you are the one who claimed the PC
> (1981), ST (1985), and Amiga 500 (1986?) were released the same year.

Sorry James.. that's an outright, blatent lie. I challenge you to show anyone where I ever said that. The private e-mail you keep posting does not contain that claim, nor does anything else I ever wrote.

YOU made that up in your own little head, after misreading and misunderstanding what I DID say, and have been letting it eat you up inside for no reason ever since then.

> I do not have a Dell PC. Where did you get this information? I am not
> "done with Atari." Where do you get this information?

From YOU, James.. or can't you even read and understand what YOU write..?

You posted a long and rambling essay on how Atari Is Dead, how you couldn't afford to upgrade your 520ST and how there is no software support anyway, and how you finally bought a Dell PC instead. You prefaced it with "I'm not bashing Atari.. but..", and proceeded to give every reason everyone else has ever posted as to why Atari was finished in the world.

Maybe it's not a Dell, maybe it's a different brand, but the fact remains that you posted your "I've bought a PC because Atari Is Dead" message, but insist on hanging around the Atari newsgroups anyway, wasting time and bandwidth for people who still use Atari computers.

(Too bad you chose not to read the messages I posted in response to your question about how to most economically expand your ST's memory, or you might actually have something relevant to this newsgroup to talk about.)

Oh well.. that's enought time wasted on you...

:they beleived Atari was committed).

I much prefer the PPC chips to the 68K ones also. When I was looking for a Mac for her, I only considered Power Mac models. It seemed stupid to me to get a 68040-based Mac, even though they are still good for most current applications, because Apple is abandoning the 68K series this year. Also, the PPC architecture is vastly superior to the 68K one (though this superiority won't be taken advantage of until next year when Apple releases a mostly PPC-based version of the MacOS and most software companies have released PPC versions of their software).

The reason I don't like the idea of her being forced to upgrade to a PPC chip (or ANY chip) is because she is not mechanically inclined and therefore would find replacing one microprocessor with another to be quite daunting. I know upgrading Macs is much easier than upgrading PCs, but it still isn't easy enough for the computer illiterate. In fact, one of the reasons why I only looked at Power Macs and ignored 040 ones, including those that were "PPC ready", was so that she would never have to worry about upgrading the chip. Now I only hope that the 040-based Mac remains viable long enough that by the time she is forced to get a PPC, it will be time to get a new computer.

:>Because the software he needs
:>only runs on Windows, that's why! He is a lawyer, and the

:available for the Atari.

There is an old saying that you should first find out what software you need, and then buy the computer that runs that software. That saying still applies today.

It's true that the basic PC architecture is obsolete and that they
are, in many ways, unnecessarily user-hostile, but it is also true
that they run over 90% of the software made today. That's why people
buy them (and put up with the many headaches they cause). It's true
that the Mac architecturally superior to the PC, but what good is
that architectural superiority when it has an inferior software library
and can't do what you need it to do.

Yes, if you want to become a k-12 library media specialist. There are many career fields that the MLIS trains you for: Acedemia librarian, corporate librarian(Apple librarian), non profit librarian and a specialist one such as a law librarian. We are in demand with the high pay to go with it.

Even though the mac is fairly easy to upgrade, unless your are very
proficient you shouldn't do the upgrade yourself. Opening the case voids the
warranty. Also, an upgraded 68K mac is slower than a real PPC mac since
it doesn't use a 64-bit data bus and doesn't have DMA on the serial/ADB/ ports.

>There is an old saying that you should first find out what software

I think that if I where going to get a computer in the near futur I would
get a PCI Power Mac with a 486dx/66 compatibility card.

Even cheaper are used SLM 605s and 804s, of course.

I think that 604-based PCI Power Macs are due out this summer but you'd have to wait for Copland.

>Out of curiosity, what kind of computer do you have right now?

I have a Atari ST and, as my main machine, a 6100/60AV. One think I've noticed is that all the former Atari users I know that have side graded to macs have gotten the AV option.

39 more lines of empty flaming again, eh James..?

I've already addressed and corrected the error I made in the private e-mail
you keep posting to the net.

If you can't read it, that's not my problem.

If you won't read it, that's your problem.

If you read it and ignore it so you can continue your pointless flaming,
then it's a problem for everyone else participating here.

In any case, it only supports my assesment of you being a twit.

BobR

OK, James.. I will say this ONE time in public.

The lines you are quoting in your signature are from a PRIVATE E-MAIL,
which to anyone else would be just that.. private.

You are posting them in public in violation of every common tenet of Internet
"netiquette".

The second line contains an inadvertant error, which I have already corrected
IN PUBLIC. If you refused to read it, that's not my problem.

I did not respond further to you in e-mail because you have already
demonstrated your willingness to violate the privacy of e-mail.

I will, just ONCE, request that you stop using my name and private statements
(including the already corrected error) in your public messages.

BobR

(This will also be sent in private e-mail so you can't say you didn't see it.)

:Even though the mac is fairly easy to upgrade, unless your are very
:proficient you shouldn't do the upgrade yourself. Opening the case voids the
:warranty. Also, an upgraded 68K mac is slower than a real PPC mac since
:it doesn't use a 64-bit data bus and doesn't have DMA on the serial/ADB/ ports.

Opening the case voids the warranty? THAT SUCKS!!
That means that you can't even add a fax modem or video card yourself
(and are therefore FORCED to pay someone else do it for you, even if
you can do it yourself).

:>There is an old saying that you should first find out what software
:>you need, and then buy the computer that runs that software. That
:>saying still applies today.

:I think that if I where going to get a computer in the near futur I would
:get a PCI Power Mac with a 486dx/66 compatibility card.
:--

I am going to get a P5-90 soon. For me that's better than a Power Mac/
DOS card combo since all the software I use runs on DOS and Windows.
Also, after 8 years of using PCs I am used to all of it's quirks, so
they don't bother me.

If I were a Mac user and didn't really need a computer right away, I
would hold off till next year. In 1996, one will be able to get a
150+ MHz, 604-based, PCI Power Mac running (the 95% native) Copland
and mostly native software. Buying a Power Mac now seems to be a
slight waste because by the time the software fully takes advantage
of it, the current models will be obsolete. Buying a 040-based Mac
(except at bargain-basement prices) is pure folly right now because
the 68K series is on the way out.

Out of curiosity, what kind of computer do you have right now?

Forwarded:

This is a clip from the May 29th issue of MacWeek:

First wave of 604s to start below $4K

By Robert Hess
The Age of Mac PCI is about to begin. Starting next month, Apple's first PCI family, code-named Power Surge, will take Power Mac performance to the next level.

> Power Mac 9500. On June 19 Apple is expected to introduce two models of the Power Mac 9500, code-named Tsunami. The company will reportedly debut the Macs that week, then show them publicly at PC Expo in New York.

The 9500 was designed specifically for pre-press and digital-video users, the same customers who made the flexible Quadra 950 a highly successful product. With copious peripherals slots and room for up to 768 Mbytes of RAM, it will offer professionals not only the most CPU power but also the greatest number of expansion options, sources said.

Two configurations of the 9500 will be offered, both based on the PowerPC 604: a 120-MHz version with prices starting at roughly $4,000 and a 132-MHz model for $4,600 that sources said is "a screamer."

As with all models in Apple's PCI lineup, pricing and configuration for the 9500 are not final and are subject to change before introduction, sources said.

Both 9500 models will come in Apple's new publishing chassis -- taller than the 8100 and containing six PCI slots and a 512-Kbyte Level 2 cache. Neither of the 9500 configurations offers built-in graphics. Instead, a PCI video card must be purchased, either separately or bundled with the Mac. Apple is expected to offer an accelerated 24-bit video card, code-named Surfer, that was co-developed with Radius Inc. and is being built by ATI Technologies Inc.

The 9500 will reportedly be the reference machine for the first PCI Macs built by vendors other than Apple. Sources said a number of licensees are considering cloning the design.

> Power Mac 8500. On Aug. 7, during the week of Macworld Expo in Boston, Apple will roll out four additional PCI models, sources said. While none offers the flexibility or speed of the 9500, some will come with Apple's next-generation digital video technology.

The Power Mac 8500/120, also known as Nitro, should cost about $3,400. The 120-MHz 604-based computer will reportedly have three PCI slots, a 256-Kbyte Level 2 cache, 2 Mbytes of video RAM and will come in a case nearly identical to the 8100.

With the addition of the 604 processor, which offers a 50 percent speed boost over a PowerPC 601 running at the same clock rate, and the performance advantages of the PCI Mac's architecture, a 100-MHz 604 Power Surge Mac would double the overall performance of a Power Mac 8100/100, sources said.

> Power Mac 7500. Code-named TNT, the Power Mac 7500/100 will form the high end of the 601-based systems and will come with a 100-MHz processor. Pricing on the three-slot model is expected to start at about $2,200 with 2 Mbytes of VRAM and an optional Level 2 cache. The 7500 will introduce a new three-slot desktop enclosure, sources said.

According to sources, the main design goal of the Power Surge Macs is to take full advantage of the PowerPC, improving the performance of both native and emulated applications. On the 7500 and 8500 this has meant the inclusion of near broadcast-quality video of 30 frames per second at 320 by 240 pixels.

Both the 8500 and 7500 will support 24-bit video on displays up to 21 inches. Their back panels will provide stereo sound-in and -out, as well as S-video and composite video-in jacks; the 8500 also has an S-video-out port.

> Power Mac 7200. For the more cost-conscious buyer, Apple will offer two nearly identical 601-based Macs, the Power Mac 7200/75 and 7200/90, both code-named Catalyst. The 75-MHz 7200/75 is expected to cost about $1,400 and will come with 1 Mbyte of VRAM; a Level 2 cache will be optional.

The 7200/90 is nearly identical to its 75-MHz sibling but for its 90-MHz 601. It will sell for roughly $1,600, sources said, and as with the 7200/75, it will be possible to upgrade the 7200/90 to a 7500/100 by swapping out the logic board. Both 7200 models come in the same chassis as the 7500.

With the exception of the 7200s, all PCI Macs will have upgrade options to a faster processor by swapping out a CPU daughtercard. According to sources, Apple has designed the logic boards to support CPUs up to a 150-MHz PowerPC 604.

> Configuration and availability. The 9500, 8500, 7500 and 7200/90 will reportedly come with at least 16 Mbytes of RAM and a 500-Mbyte hard disk; all six will include a quadruple-speed CD-ROM drive. In addition, the 7500, 8500 and 9500 will all offer internal Fast SCSI interfaces, sources said.

Apple is expected to have all of the new Macs available for purchase at the time of introduction. However, sources said availability of some models, such as the 9500/132, may be constrained for a few months because of a shortage of the higher-clock-rate PowerPC 604 chip.

Apple declined to comment.

The PCI Power Macs at a glance

L2
Code Street Cache RAM PCI VRAM
Product Name Price CPU MHz Kbytes Mbytes Slots Mbytes

Though I agree on the modem part (got me an external on my PC) I do hate
Mac built-in video. "What? The resolution depends on the monitor I
have hooked up? What if I want 1024 x 768 on a 14 inch screen. I only
can get 640 x 480?" You get the idea, I'm sure. Of course, most Mac
video cards won't change this, but they do give you more flexibility.
Other than using system ram for ease of page-flipping (which the macs don't
do) I see no reason for built-in video.

>I have a Atari ST and, as my main machine, a 6100/60AV. One think I've noticed

I know that if I ever went mac (shudder to think) I'd be tempted by the AVs,
since I'm spoiled by the Falcon. Of course, I kept the bird for MIDI and use
a 486 for my main stuff.

Look, if your going to need a larger screen with higher resolution than you
have other choices such as the 6100/7100/8100 line. Why is this so difficult?

I have a Performa 550. I use PowerMacs in the lab. By August, I should have my own Powermac. I have not decided on the model yet.

I didn't know that you could force any monitor into a lot of resolutions.
But my built-in video does give me 600x800 on my 14" inch screen. One
good thing about the macs built-in video is that it saves you money on
a video card. BTW, the Q630 can do page-flipping.

>I know that if I ever went mac (shudder to think) I'd be tempted by the AVs,

Macs just aren't that bad. I was thinking about getting a Falcon instead of
my 6100 but the math just didn't work out. The Mac had as good a sound,
better video, more RAM, a faster processor,larger hard drive, and a fairly
decent operating system that will hopefully get better. I have my ST for
MIDI work.

The rationale behind that was to keep all displays 72dpi and thus preserve
WYSIWYG. In any case, 72dpi is out the window. All you need to do is hook
up a Multisync monitor with the appopriate cable (or use Apple's nice Multiple
Scan monitors) and the latest Monitors control panel, and you can switch
resolution at will -- without rebooting or interrupting any active program.
If you want 1024x768 on a 14-inch screen all you need is enough video memory,
the latest Monitors control panel, and a monitor that can handle it.
(And of course, glasses so that you can read the small text.)

:>you can do it yourself).

:I think it's silly to buy an internal fax modem and I like the macs built-in
:video just fine but it sucks to have RAM installed. It's not actually a
:problem, you simple add the component youself and then, if you have a
:problem, simple don't tell them that you opened the box.
^^

Great idea! I should have thought of that.

I personally like internal faxmodems better because they take up less
space, but that's just my preference. If I had a desktop and a portable,
and used them both, I'd agree with you, but since I just have a desktop
(and never intend to get a portable unless I absolutely have to) the
internal faxmodem is just fine for me.

:>If I were a Mac user and didn't really need a computer right away, I
:>would hold off till next year. In 1996, one will be able to get a
:>150+ MHz, 604-based, PCI Power Mac running (the 95% native) Copland
:>and mostly native software. Buying a Power Mac now seems to be a
:>slight waste because by the time the software fully takes advantage
:>of it, the current models will be obsolete. Buying a 040-based Mac
:>(except at bargain-basement prices) is pure folly right now because
:>the 68K series is on the way out.

:I think that 604-based PCI Power Macs are due out this summer but you'd have
:to wait for Copland.

Yes, I know about those, thanks to c.s.powerpc, PowerPC News, and Sinflop's
mail barrage. But they cost 3 to 4 grand. By mid-late 96 (around the time
Windows "95" comes out ;-)) they will probably cost around $2000 and
come preloaded with Copland. They will also definitely run at higher clock
speeds (probably 150-200 MHz or something like that -- I had read that 132
was the 604's highest speed, but I seriously doubt that that is true).

:>Out of curiosity, what kind of computer do you have right now?

:I have a Atari ST and, as my main machine, a 6100/60AV. One think I've noticed
:is that all the former Atari users I know that have side graded to macs
:have gotten the AV option.

Side grade!? I think that you've just coined a new phrase.

What kind of AV abilities did the ST have. If the ST had built-in AV standard, I wouldn't be surprised that all the Atari users who have bought Macs got AV models; who wants to give up something that they've taken for granted for years?

I'm doing an article about computer myths and I'd like people to submit anything they know of other people who believe in faulty myths to do with computers... like that Bill Gates personally invented the PC or that a PC is better than a Cray, or that that Windows was the *first* GUI.

The more detail you can give me, the better; if you can give credit to a particular authority for the mis-information, a newspaper for example, even better.

Sure. On my 15" monitor, I can do anything from 640 x 480 to 1280 x 900.
The limit is in what the video card will do. On my falcon, I can (via
blowUP) drive a monitor at just about any resolution so long as the sync
frequencies match.

It's nice to know that Apple has finally done something my ST could do in
87. Heck, my 8 bits could do it long before.

Also, video cards aren't that expensive. My 2 meg card (upgradeable to 4)
was under $200 a year ago.

>Macs just aren't that bad. I was thinking about getting a Falcon instead of
>my 6100 but the math just didn't work out. The Mac had as good a sound,

I used Macs for over 2 years daily while working before I went back to
college. I hate the OS. As for the other points, I've got 14 megs in my
Falcon, a 540 meg external drive, I run it at 800 x 600, and I prefer the
GUI to the mac one. It works fine for anything I use it for. The main reason
I own a PC is because I didn't pay for it (Parental units can be good at times)
and it was an experience putting it together from pieces.

If sinclap can be a fanatical Atari-hater, I doin't see any reason why I cannot
be a fanatical mac-hater. :) At least I've used the machines extensively,
though. Heck, I could probably go out today and land me a job supporting
the things. It's just that I have principles to uphold. ;)

I just cannot agree with Apple's time-honored philosophy of "Hide the user
from what's really going on and, where possible, don't let them think for
themselves. Let the computer do the thinking"

I believe that the best user interface is a simple one. It shouldn't try
to guess what the user is doing and react contextually. It should present
a simple way for the user to do what they need without ever worrying about
how the computer will interpret its actions. That's why I prefer GEM over
both Mac and Windows.

No, but what ST user would buy a spankling-new Mac that couldn't outperform a
Falcon in every way? :) Otherwise they'd be forever tempted... :)

I think you can install VME boards in a MegaSTE/TT without voiding the
warranty. And on some models, they didn't have the warranty sticker on the
drive screw, so you could upgrade the ram and the HD without voiding.
But hey, your average PC clone can be upgraded without voiding the warranty,
sure. What about pre-built systems from Compaq, Dell etc.? Especially the
ones in the foetal attached-monitor cases?

Why sell a machine that has a built-in monitor? That's what we're arguing
about (at least I am) I think it's really a bad idea for any company to do
it. It limits the customer's ability to improve their machine, and the only
motivation behind it is "hey, if they want to get a bigger monitor, they'll
have to buy a whole new comuter! Look how much we can gouge from them!"

It's nioce to know that they finally dumped that. I haven't kept up with
Mac news since mid 93 or so (since I started COllege and have been using REAL
computers)

It's kind of funny that the very thing that Mac advocates were shouting with
pride a few years ago is now dumped because it doesn't make sense (and
never did)

"72 DPI is enough for anybody" -- someone at apple, probably ;)

BZZT..The MegaSTE/TT and all other Atari computers are out of warranty since
Atari is out of the market and soon out of irrelevance!!

Tell that to the Millwaukee School System that just bought 3,000 of the 5200.
If you know your going to need a larger screen there are other choices, not to
comprehend is it MR.OATS!! How did you get into UCSC? Some affirmitive
action. I hope it doesn't cheapen my mom's diploma..

I have PageStream and use. I do, however, agree with you. PageStream is no Page Maker. I also have Calamus SL. It is an excellent program and is just as good or better than Page Maker. If you would like a copy I can tell you who to call to get a copy. Or you could just wait for the Windows version.

First off, it's Oates. Notice the E. Secondly, I guess my 4.0 GPA and
1460 on the SATs convinced UCSC that I was a good candidate. Yes, I know I
could have gotten into "better" schools, but I thought I'd take college a bit
easy, do it in 4 years instead of three like I could, and spend my time in
the beautiful Santa Cruz area.

Gads, I hate sounding like I'm bragging, but he did ask for it...

Heavens no. The PowerPC 604 is a (for now) high-end chip. The PPC604
is twice as fast as the PPC601 at the same clock speeds, and the
PPC604 will start around 120Mhz. This means that systems using the PPC604
will be around 2 to 4 times as fast as current PPC601 systems,
and up to FIVE times faster than 50Mhz 68060 systems (since the 68060 is
about on par with the PPC601 at the same clock speeds).

If she had class, she would buy the PlayStation..In the recent issue of Next Gen., the feature spread is on Sony and the Playstation. Looks like Sony had their act together when developing the PlayStation and doing it right. The games that were shown make the Jagflop games in the Atari ad look like 2600 style games.

Calling the Jagflop 64 bits is a fraud, get over it..

I have seen enough to know that the PlayStation titles make the Jagflop ones look like 2600 style games with the exception of AVP. Come on, you have to admitt that the Sony console titles shine..

>

>

Correction: The PlayStation is much better by a wide margin. The Jagflop titles do not measure up and thats a fact pal..

Specs, specs, specs, so what!!! It's the quality and the shine of the titles that matter..

No, we have Mr.Oats left hand to do that. Have you been to the Reference Desk in your school library? Thats one role of a librarian and another is to seek out sources and information.

I am specialising in becomming a K-12 library media specialist. I will instruct students on how to properly access and were to find sources of information inorder to seek knowledge. Also I will become in charge of the show and will have staff to shelve material.

Many career oportunities. Corporate and non profit librarians, medical and law librarian, library media specialist, acedemia specialist and librarian. A Electronics degree is helpful. My superior is head of the library computers and information systems with an emphasis in setting up and maintaining Novel Networks. I get to unpack the GateWays and install.

My mom received a 4.0 from De Anza College in Cupertino. Allowed her to receive complete funding at UCSC. Her 4.0 at UCSC landed her with full funding at Yale. She turned down Standford.. Oh well, I miss Santa Cruz and living on the coast. I wonder if my tree fort exists in the RedWoods below College 5.

1577. Sinclair and the Amiga

Newsgroup: comp.sys.atari.advocacy
Date: 1995-06-01 00:00:00 UTC

Message-ID: <95152.183615STIRRE31@MAINE.MAINE.EDU>
Source record: 12578

Pete,
Awhile back you claimed that the only thing that an Amiga was good for was formatting a disk and playing a 2600-style game (which must mean that it is _fun_ :-).) Now you are heralding the Amiga and planning on getting one. Why the change? You were pretty adamant about putting down the Amiga before. Perhaps if you acutally used an Atari product you might like it. Admit it- the Lynx is great and 80+ games available at $15-19 each is nifty. The 7800 only had a library of a gazillion or so games (counting 2600 games). So what is wrong with these products?
BTW, I noticed you praised the Playstation. I have a feeling you'll change your tune when the Pippen (har har) comes out. Besides, you also said how great a 3DO was. Is your criteria for a good product one that does not have a fuji symbol on it? Pretty pathetic.

```
: If she had class, she would buy the PlayStation..In the recent issue of Next
: Gen., the feature spread is on Sony and the Playstation. Looks like Sony had
: their act together when developing the PlayStation and doing it right. The
: games that were shown make the Jagflop games in the Atari ad look like 2600
: style games.

More net exageration. Gee Peter, you're not biased at all.

: Calling the Jagflop 64 bits is a fraud, get over it..

You've never even seen the machine or played *ANY* games so shut
up. You aren't exactly a pillar of information in this area.

It is a 64 bit system because it has five processors, two of
which are 64-bit, all of which work in parallel. 64 bits of Data is
transmitted through the 64-bit databus. Translation: 64 bit system. The
Playstation is slightly better because it's got a CD-ROM and some
improvements in hardware with regards to polygon handling and texture
mapping. The Jag handles more data per second, do to the databus it has.
The Playstation seems fairly similar in regards to memory, and color
palettes. Of course, you wouldn't know this because you've never looked
up the specs for either machine.

Peter now states in his sig that he is getting a powermac in August.

Last year you said that you were getting a powermac upgrade for your currently owned Mac.

LiesLiesLies.

Oh, and now you are getting a Amiga with the toaster...I thought you were a lowly uni student....ahh student loans again petey???

You do know they have to be paid back don't you??

At least you've toned down your sig....why have you started to become painfull again?...you were actually informative and relatively non inflammatory for about a month there (although that's when kenneth was about)

Oh, I better advocate Atari here:

The Sonovista (Falcon) system rocks, and I would like to see another system do the same with the same ease and set up costs...now if I had some money :(

Oh, BTW in Australia, Powermacs start at about $7000.....mass market?? I think not. If that is the case expect to see Pippins over here for about $4000.....mass market 'player' (uuurgh)...I think not.

[Article crossposted from comp.sys.amiga.misc,comp.sys.amiga.advocacy,comp.sys.cbm]
[Author was Jason Compton]
[Posted on 1 Jun 1995 19:48:46 GMT]

Thought you Atari advocates might be interested in the _official_ news on the plans for the Amiga from new owners ESCOM.....

Gilles Bourdin, head of PR for Amiga Technologies GmbH, has requested that I post these transcripts from the May 30th press conference held in Frankfurt.

Frankfurt/Main, May 30, 1995

Speech of Manfred Schmitt
Escom AG
Chairman of the Executive Board

Ladies and gentlemen,

Since we won the auction for the intellectual property of Commodore and Amiga, the ESCOM AG is flooded with congratulation messages. Amiga clubs and Amiga users write to ask us to revive and continue to develop and improve the Amiga. Many of them actually sent us their wishes for future hardware architectures and operating systems improvements.

However, it is still unclear for many users how a PC manufacturer and retailer will use the Amiga technology.

Here is our answer:

ESCOM now turns from a PC manufacturer and retailer into a multimedia company. The big multimedia applications will come very soon as Pay-TV, Video on demand, homebanking, home-shopping and online services. In this growing market, we want to become a leading provider of hardware, software and solutions. Our goal is to give the user a cost-efficient way to access all these new services the multimedia world will allow. The Amiga technology brings us all we need here in an elegant way. We see in the Amiga the key to Multimedia technologies for the future.

As an intelligent terminal, you all know the PC. Many people use the PC in conjunction with a modem to access online services and the worldwide Internet. Escom is providing that market with a wide palette of advantageoulsy priced Multimedia PCs in a range between 2000 and 3000 DM.

But there are other user profiles, who want to use the multimedia technology without having to spend several thousands of DM. For these users, the Amiga

represents a very interesting alternative. It stands out with an amazing price/quality ratio. Also remarkable is the operating system with a still unmatched multitasking ability. That means that several applications can run simultaneously, depending on available memory without slowing down the whole system. This is achieved by the smart resource sharing of the system and the low consumption of RAM and processing power by the applications.

The Amiga operating system needs 8 times less memory than Windows, and it multitasks better than Windows. Through this smart use of system resources, the Amiga is still a very efficient and unexpensive computer.

Video is another strength of the Amiga. In this aspect, the Amiga is superior to the PC. The video output of the Amiga is already PAL and NTSC compatible, so it can just be plugged into a TV or any video monitor. A PC needs a converter to do this. The Amiga represents a possibility to give people access to interactive television, online services and pay TV with set top boxes at decent prices like 400 DM. The market is huge because there are much more televisions than computers in the homes.

The set top box is a concrete application involving Amiga technology that we want to improve. For the American market, which is much more advanced than in Europe in this regard, we already have license agreements with our partner VisCorp - our first licence by the way. We are willing to be very flexible and open-minded regarding licensing of our technology. Amiga developers and manufacturers shall have the chance to talk with us to define partnerships or license agreements. Together, we will develop a wide range of Amiga hardware and software. Our goal is a productive, open amiga technology. The example of Viscorp demonstrates it at best : we license Amiga technology to people who want to integrate it in their own products. The press already talked about another partner, the Tianjin Family-Used Multimedia Co. Ltd. They will build the lower range of Amiga computers and revive the legendary Commodore 64 for the chinese market.

Ladies and gentlemen, we have mainly talked about the Amiga. In New York, we also took over another well known brand : Commodore. All of you surely remember the good old Commodore 64 and its tremendous success in the early eighties. It is still a famous episode in the home computer history that could be compared to the Volkswagen Beetle. A recent study made by the german economic magazine DM reveals that the name Commodore still has very high recognition. 93 percent of all PC users know the trademark Commodore. such a reputation is only surpassed by IBM.

We will now separate Commodore and Amiga operations. Amiga will be the multimedia range with Motorola processors and Commodore for Intel based Personal Computers. We want to use all available and appropriate distribution channels both for Commodore and Amiga: specialized retail stores, warehouses, and mail order services. The ESCOM subsidiaries are only one of many possibilities.

Ladies and gentlemen, we are convinced that ESCOM, Commodore and Amiga will become a sucess story. Look at the structure and competencies we have built up in a short time.

Thank you.

****

Petro Tyschtschenko

Ladies and gentlemen,

As the General manager of Amiga Technologies GmbH, I would like to welcome you to the first press conference of our new company and also tell you how much we appreciate your presence here.

At a spectacular auction, five weeks ago in New York, ESCOM AG acquired the rights to the intellectual property of the former Commodore company for 10 Mio $, including all trademarks, logos, products and licences.

Since the day we succeeded in buying the Amiga technology, many people have asked us how the future will look for their computer of choice. We got floods of anxious faxes and letters to which we couldn't give an answer at once because things were too early to comment. We will use the opportunity we have now to talk to all of you and present the new Escom daughtercompany, Amiga Technologies. Some leading developpers of hardware and software for the Amiga as well as some of our new licensing partners will present themselves and their projects to us.

To clear up things from the beginning, - and that's the point you are all interested in - I want to make the comittment that we are determined to resume production and also want to continue hardware and software development of what we believe is a superior technology. That's why we created Amiga Technologies and we are now hiring the best and most capable people to accomplish this.

For a sucessfull Multimedia company like ESCOM, the Commodore Patents and licences concerning Amiga are considered the key to multimedia technology. Mister Schmitt will say more about this later.

But let's concentrate on our immediate plans. As the director of Amiga Technologies, my first priority now is to resume production of Commodore and Amiga computers and bring them on the market as soon as possible. For us, this means September 1995.

I would also like to refer to Commodore computers, Pentium PCs, which will be available in August this year. These will be fully loaded P75 and P100 multimedia PCs. They will be assembled in our own ESCOM facilities. We plan to sell between 50 000 and 60 000 units before the end of this year. Let me point out that the Commodore and Amiga operations will be separate, Amiga Technologies will only take care of Amiga, whereas ESCOM will provide Commodore PCs.

One month later, we will start producing the high-end multimedia Amiga 4000 T. To succeed in keeping that tight schedule, we negotiated with well known producers in Europe and Asia. For the selection of the manufacturing partner, we will be emphasizing the quality requirements.

Until the end of the year, we plan to produce enough machines to meet the demand. These machines are already outsold in preorders. In October, the production of the low-end A1200 will begin. We expect to ship enough untis as well as CD 32 game consoles to meet the Christmas season demand. Please give us more time to publish quantities.

The takeover of the inventory, which is mainly composed of spare parts, in the UK and Germany is completed. The rumoured stocks of new Amigas ready to be sold do not exist. For inventory in the Phillipines, we are currently negotiating with the local trustees.

Ladies and gentlemen, the new Amiga Technology will now become the operating center of an international Company held 100% by ESCOM AG. Our headquarters in Bensheim will employ around 50 people for following tasks : development, support to developers, resellers, and users, production management, Marketing, PR and administration. We also took over the former Commodore development center in Norristown, with its research and development facilities. Eduard Goff, former Vice President and General counsel at Commodore now leads that center. He will talk to you later. Our developers are now working on the next generation RISC based Amigas as well as on improving current models. Here, we are working in a tight partnership with SCALA and MOTOROLA.

Amiga Technologies GmbH expects a turnover of 100 Mio DM in 1995, mainly from the Christmas business with Amiga 1200, 4000 and CD32. Our monthly expenses are evaluated at around 600 000 DM. The break even point should be reached this year. We are confident that we will have rentabilized our 10 Mio $ investment by spring 1996 with Amiga sales and licences.

Thank you.

You did not read correctly..There is no question that the Amiga has fallen
behind. The games are dated as well as the hardware. If C= was able to
maintain consistent development in hardware/apps, the Amiga would of been the
ultimate Multimedia machine. I had an offer to buy a Toaster 2000 system for
very little money. But I had second thoughts because the system was out of
warranty (how would it be repaired) and that LightWave will be ported to the
PowerMac.. I happen to read the specs and the awesome prices on the upcomming
7200 line. Ligtwave would fly at the speed of light on a 75-90 mhz PPC601
machine than the slow obsolete Amiga 2000/030 at the same price level.
Escom is going to release the current models such as the A1200 and A4000 which
at slightly less prices but still not competitive than Pentium and the
Powermac..

The PlayStation blows away that 64 bit fuji, its a fact. The Pippin will have
its own market to serve. A combo of multimedia/games as well as a tool to
access the net with netscape and the likes. 3do shines because the titles are
there. I maybe tempted to opt for the $299 GoldStar 3do with two packins..

The PlayStation will have numerous quality games. Sony has bought Psygnosis who made their name on the Amiga. The software firm has hundreds of employese that will be cranking out quality titles. Sony is serious and making the strategies to do well. What about Atari? Why are Jagflop owners complaining about the lack of games and quality? Give it up!!!

: I have seen enough to know that the PlayStation titles make the Jagflop ones
: look like 2600 style games with the exception of AVP. Come on, you have to
: admitt that the Sony console titles shine..

Peter, you can't just a game by still pictures alone. Tempest
2000, Iron Soldier and Hoverstrike don't look like much until you see
them move. Then you know you aren't looking at an SNES game. As for
Playstation making the Jag games look 2600 style, net exageration is a
problem. The PSX games do look very good, but not *THAT* good.

: Correction: The PlayStation is much better by a wide margin. The Jagflop
: titles do not measure up and thats a fact pal..

You've never tried games for either machine. The PSX really isn't
better in most areas. It's got some hardware to give it better abilities
to do stuff like polygons and texture mapping. It does not have more
colors, superior resolution, faster speed, more memory etc. And by the
way ... I'm not your pal. I choose my friends via many criteria ... of
which you have none.

: Specs, specs, specs, so what!!! It's the quality and the shine of the titles
: that matter..

Very true. You're also comparing a cartridge-based machine vs. a
CD-ROM based machine. The storage medium lends itself to holding some
effects which require lots of memory. The only machine you can really
compare the Jag cartridges to is the 32X. It's a "32-bit" machine as well
and the Jaguar clearly shows it's superiority.

Am I having delusions, or did Sinclap first rip the Jag for (in his
misinformed opinion) not really being a 64-bit console, and then (in
a follow-up) claim that specs (like bitness) are meaningless and the
reason why the Jag sucks isn't because it's not 64 bit but because
it has a substandard software library?

In other words, he first ripped the Jag on technical grounds, and then
ripped the Jag for its lack of software, stating that technical specs
were insignificant. SINFLOP, THAT'S INCONSISTENT!!! How do you
expect to make a convincing argument when you regularly contradict
yourself!? You are even more pathetic than I thought you were!

Next time, THINK before you post your crap! You may save yourself a
lot of embarrassment.

: The PlayStation will have numerous quality games.

From what I've heard so far, they've got a few real winners and
quite a few doozers. Of course I haven't seen the PS yet, but hey ...
making assumptions on something you've never seen hasn't stopped you from
arguing.

Sony has bought Psygnosis
: who made their name on the Amiga. The software firm has hundreds of employese
: that will be cranking out quality titles.

Good for them. Atari has TWI, Williams, Jaleco and a pile of
other companies. They aren't exactly without support. I'm sure Primal
Rage, Mortal Kombat III, NBA Jam and all those other titles will do
nothing for the Jaguar.

What about Atari? Why are Jagflop owners complaining
: about the lack of games and quality? Give it up!!!

I don't hear people complaining about a lot of things that were
shown at E3. I don't hear people complaining about the VR Helmet. Why
don't you give it up? Your biased, uninformed, circular drivel of an
argument is bothersome.

: > You've never tried games for either machine. The PSX really isn't
: > better in most areas. It's got some hardware to give it better abilities
: > to do stuff like polygons and texture mapping. It does not have more
: > colors, superior resolution, faster speed, more memory etc. And by the
: > way ... I'm not your pal. I choose my friends via many criteria ... of
: > which you have none.
: >

: Listen...The PSX is on tops, GET OVER IT.

Once again ... you ducked the statement " Peter, you've never
tried either machine." But that's typical of you, you biased,
closed-minded pest. I'm sure the Eagles are really thrilled that you
quote their song all the time.

. And now that the GoldStar 3do is
: now $299 with two packins, the Jagflop is less atractive to invest..

Do you honestly think Atari isn't working on lowering the price?
That's how competition works.

: Who cares about the 32x.. The Jagflop is in competition with all of the
: consoles, GET OVER IT!!

I was just making a point ... one which seems not to have
penetrated your thick, THICK skull.

I think the idea will appeal to people who don't want to mess with a lot of different pieces and wires to connect them all.. someone who is concerned with things like upgrading will probably opt for a model with a separate monitor anyway.

The Atari 1040ST was very well received after the 520 ST because it incorporated the floppy drive into the main case, eliminating another box, a connecting cable, and a separate power supply and line cord.

The integrated case/monitor will probably appeal to some buyers in the same manner.

I don't believe I've ever seen a PC system whose warranty would be voided by opening the case... in fact, most manuals include detailed instructions on how to open and upgrade the systems.

Gateway 2000 has an entire separate manual showing how to install upgrade or replacement parts in their pre-built systems, even.

> but I seriously doubt that that is true).

This is interesting, as I just cleaned out a bunch of old PC Magazines, and one issue was reporting on their test results from a batch of new, "high speed" ATs running at 12 and 16 Mhz.

The 16 Mhz machines were definately fast, but tended to be somewhat flaky, leading PC Magazine to recommend NOT purchasing one, but sticking to the more stable 12 Mhz machines.

A sidebar talked about why the 16 Mhz machines were so marginal, and said that the limits on CPU speed had been reached... due to quantum physics, no faster clock speeds were possible, so further improvements would have to take other directions... multi-processing was the next big step they foresaw.

I love reading stuff like this, and why something is just "not possible"...

:)

Besides, the OLD Lynxes stink. That $.02 part that the adaptor plugs into on the Lynx broke on mine, and I understand on a lot of other peoples' too. When I called Atari, they said they wanted $50.00 to fix it! I did a little snooping, and found that they don't even do that. They just send you a new Lynx, maybe not even the kind you had (IOW they'd send you a Lynx II).

I _love_ my Lynx (especially Zarlor Mercenary & Ninja Gaiden), but until they fix my Lynx for a fair price, I won't buy one. I wish someone would make a gadget so I could play my Lynx games on my Falcon (or even STe, I guess!). That would be great.

Just my $.02 worth :)

Atari Benelux had a sale about 6 months ago where I was able to purchase
a number of development machines including the replacement TT called the
Atari BlueTTit (BT) 040. Then of course the Atari Budgie 020
and the Music Workstation "Humming Bird 010". Not forgetting the 060 based
Atari Shag 060.

During the mid eighties they also had the replacement XE games console called
the "Atari Turkey 65"

I asked Sam Tramiel to comment on these names and was told "Tweet, tweet,
cheep", he then ate some seed and flew off :)

: Are they still making ST's? I've never seen a new one for sale here in
: ities do they have as far as colors,

ST's aren't officially being made here in the North America (they
are ten years old now), but people in Europe have an easier time finding
them. ST's are a steal on the second hand market.

: resolution, and sound? What kind of processor do they use? Are there any big
: software places such as EA supporting ST's?

First of all, the ST is old. The world is basically a PC-run
place with a few Macs thrown in. The Amiga is used a lot in desktop video
markets and the ST has a niche in MIDI markets. Because the ST is now out
of the mainstream, it isn't supported by many companies anymore. If you
don't mind older software, there are plenty of programs by most big
companies out there.

Resolution, colors, etc is difficult to answer becayse the ST is
not one machine, but a line. Same with the Amiga. I'll try to answer as
best I can, but I might be dead wrong because I haven't used that many
machines.

Resolution Colors Processor

Atari 520ST up to 640 * 400 512 68000
(512K RAM)

Atari 1040ST
(1 meg of ram) Same as 520ST * *

Atari Mega ST Same Same Double speed
comes in 2,3,4 meg models 68000

Atari TT Not sure, but much higher 68030
(1000? *800? isn't it?)

Atari Falcon Not sure offhand 256,000 68030

: I have an Amiga, are they better? (that ought to start something...)

Each machine has it's strengths and weaknesses. System loyalty
aside, in the late eighties, I would gladly have purchaced an ST or Amiga
over a PC anyday. Both were fine machines. However,

- The Amiga was more popular and received more software support.

- The Amiga always had a slight edge in graphics and sound, though
the ST wasn't shabby by any standards.

- The Amiga could do Multitasking

- The ST has a built in MIDI port and was better for musicians

- The ST's high res text screen was awesome for doing word
processing on.

- I found the ST a little easier to use, though that's my opinion

I'd give the Amiga the edge overall, but I also won't say that
the ST was a bad machine or "ten times worse than the Amiga" (typical
Amiga fanatic) because it isn't.

: > had a library of a gazillion or so games (counting 2600 games).
: > So what is wrong with these products?

: You did not read correctly..There is no question that the Amiga has fallen
: behind. The games are dated as well as the hardware. If C= was able to
: maintain consistent development in hardware/apps, the Amiga would of been the
: ultimate Multimedia machine. I had an offer to buy a Toaster 2000 system for
: very little money. But I had second thoughts because the system was out of
: warranty (how would it be repaired) and that LightWave will be ported to the
: PowerMac.. I happen to read the specs and the awesome prices on the upcomming
: 7200 line. Ligtwave would fly at the speed of light on a 75-90 mhz PPC601
: machine than the slow obsolete Amiga 2000/030 at the same price level.
: Escom is going to release the current models such as the A1200 and A4000 which
: at slightly less prices but still not competitive than Pentium and the
: Powermac..

Escom is re-releasing the Tower A4000 with M68060's, LightWave will run
faster than any Pentium based machine, and Yes even the new 160 Mhz
Pentium machines. Thought not faster than the Raptor (based on Alpha RISCS)...

Who cares that $250 million of sales of apples were made in Australia?

About 80% of them were to unis and other such institutions....bugger all home computer enthusiasts buy Macs...only cluless ones who need a baby of an OS to help them along...:)

BTW: why get a $299 Goldstar 3DO, when the Playstation will cost that cheap upon release anyway??? No-one has seen these cheap 3do's since they were announced last year...even in the 3do newsgroups, no-one has seen the below $350...

So much for Apple's big advantage that upgrading would be easier and cheaper.
I knew it all along.

Mark Rathwell (mrathwel@uoguelph.ca) wrote:
: : I have seen enough to know that the PlayStation titles make the Jagflop ones
: : look like 2600 style games with the exception of AVP. Come on, you have to
: : admitt that the Sony console titles shine..

: Peter, you can't just a game by still pictures alone. Tempest
: 2000, Iron Soldier and Hoverstrike don't look like much until you see
: them move. Then you know you aren't looking at an SNES game. As for
: Playstation making the Jag games look 2600 style, net exageration is a
: problem. The PSX games do look very good, but not *THAT* good.

I just saw a PSX in our local Virgin Megastore, even though it was only
b&w since the TV couldn't handle NTSC signals, the games (Ridge Racer and
Toshinden) were just plain _awesome_. Right next to the PSX was a Jaguar
running probably its best game, Doom. You had to notice how far ahead the
PSX was. I was looking at Doom as I have been playing on the PC over a year
ago, but the PSX stuff was out of this world. I've never seen anything look
that good.......

: : Correction: The PlayStation is much better by a wide margin. The Jagflop
: : titles do not measure up and thats a fact pal..

: You've never tried games for either machine. The PSX really isn't
: better in most areas. It's got some hardware to give it better abilities
: to do stuff like polygons and texture mapping. It does not have more
: colors, superior resolution, faster speed, more memory etc. And by the
: way ... I'm not your pal. I choose my friends via many criteria ... of
: which you have none.

uh? 'The PSX isn't better in most areas'?????? It blows the Jaguar out of
the water on all fronts. I think the Jaguar can boast a potentially higher
resolution (which hasn't yet been used in any games which tend to be 320x200
anyway) but thats all. gfx, sound, tmapping, polygons - the PSX is already
way ahead of the Jaguar.

: : Specs, specs, specs, so what!!! It's the quality and the shine of the titles
: : that matter..

: Very true. You're also comparing a cartridge-based machine vs. a
: CD-ROM based machine. The storage medium lends itself to holding some
: effects which require lots of memory. The only machine you can really
: compare the Jag cartridges to is the 32X. It's a "32-bit" machine as well
: and the Jaguar clearly shows it's superiority.

ahem, Jaguar advocates are always complaining that the carts for the jag are
a better idea... Why should we limit comparisons to a cart-based machine?
If carts are so good, why is Atari going to bring out a CD player??

The one thing you can say about the Jaguar is it offers good value for money specs wise. Unfortunately, its just a tad pricier than the Super Nintendo which has a better variety of software, and although its cheaper than Saturn or PSX it will have nothing to compare to their software and specs either. Whatever way you look at it, it falls between two stools.

Even when the Jaguar was _the_ most advanced console, Atari didn't exactly sell a million. Remember this was the machine that was going to save Atari by putting them back at the forefront of gaming technology. All thats happened since is that Atari have given up on making computers......

>software places such as EA supporting ST's?
>I have an Amiga, are they better? (that ought to start something...)
>I'm just curious and I would appreciate any input anyone might have. ThanX.

Most of the big software developers such as EA and Microprose have all but
left the Atari scene. However there are loads of independents who really
are beginning to produce some pretty good applications and games. The
DTP and Worldprocessors, Calamus and Papyrus are both excellently priced,
are easy to use and have a superb range of functions. As for games the
ST is now suffering somewhat, the STE is really the bottom machine that
I personally would recommend.

On a performance basis the ST is as good as any Amiga 500/600/1000 it
has a pallette of the same size, excellent sound and the O/S has (I believe)
quite a few improvements over earlier versions.

Now for the comparision, the Amiga 1200 is in my opinion better than the
ST/STE, it is faster, has a better OS and more software. However if you
go for Atari's big bird (Falcon 030) then the competition is a bit tougher.
The Amiga certainly has more software, but for realtime graphics out of
the box the Falcon with its DSP really kicks ass! The F030 with Apex media
really is awesome!

Yes, I expected that kind of statement. Petey-boy, as you have proven in
numerous articles that there isn't even a decent spell-checker for the
Mac, that you are constantly talking about machines you can't even afford
and still just sit around with your Mac plus, it is obviously _you_ who
needs the reassurance that he's got The Best Computer (tm). In fact, Macs
aren't qualifying to bear this label, IMHO, as they have so many flaws in
their OS and hardware. If I were to buy a new computer, it surely wouldn't
be a Mac, even if the machine had a PPC, I'd prefer an IBM or Motorola
CHRP machine over an Apple one, just because I can't stand the attitude of
Apple owners like _you_.

In fact, my TT fully satisfies my needs, and will do so for some more
years.

Actually, you do. Here at UCSC, for example, there is only one undergraduate level class in graphics. All the others are graduate-level. Since I'm taking that one class right now, if I want to continue my studies in graphics, I'll have to wait until grad school or weasel my way into the grad level classes. Of course, I'm seeing my advisor on wednesday to pursue that second option.

Hell, you can get a job with a good company on just a high-school diploma.
COmputer science is a field where, in the smaller companies, you can actually
get employment based on merit and not degrees. I'm in college and will
continue on to grad school because (and here's a shock) I actually am enjoying
my expereicne and want to learn as much as I can.

I'm amazed. petey's found a new obsession. My left hand: that sinister appendage, committer of gauche acts. (points to those who can spot the puns)

He dwells on it, talks of it time and again -- perhaps even in his sleep. I think he loves my hand and wants it for himself.

I hate to disappoint him, as my left hand is far too busy to please him in any way. It controlls the left half of my keyboard while typing, the lower notes while playing musical keyboards, and the Jaguar joypad during those rare times when I can find time to play games. It writes when I use a pencil, and it fights when I hold a sword.

No petey, this hand is my hand, this hand ain't your hand.

If you remember rightly there was also the ARSE project, it was
basically an advanced sound system ARSE standing for

ADVENCED REAL SOUND ELECTRONICS

it was the forerunner to the DSP, it was basically three chips one
dedicated to input, another to output and another for processing
advanced wave form logic :-)

> although its cheaper than Saturn or PSX

Unfortunately that's only true of the base console... by the time you add the Jaguar CD drive, the prices start levelling out pretty quickly.

Also, Jaguar games have been hitting the stores at around $70.. the Saturn games are consistently lower priced, with $60 the top end, and several coming in at lower levels.

Depending on how many games you purchase for a Saturn, the price difference can be made up in savings on the cost of games.

Where are all the cool Jaguar games? My roommate has Iron Soldier (slow) Alien Vs. predator (slow and frustrating) Doom (great).. has this thing flopped on its face? It seems quite embarassing when I see some of the new 3do games, or the commercials for the Saturn.

It's a good thing that I don't care much about video games anymore, cuz the Jaguar seems to be an endangered species. Any comments?

You make it sound like that the all in one mac is the only model in line up.
15' is pretty standard, plus you can hook up another monitor to the Mac. Do
you use a monitor that is larger than 15'? Considering that the Performa
5200/8megs/800 meg hd, 4x cdrom costs $1749 US, you call that price gauging? A
14 meg Falcon with 80 meg hd costs $1899 list.

Look, if a company steals from some people but is reasonable (I use the term looseley when it comes to Apple) -- I'm sure you'd say, "You make it sound like stealing is all they do" -- Because Apple sells a unit with a built-in monitor, which I feel is a rip-off of the consumer, I have a problem with that.

I have a 15" monitor for now. When the price on 17" monitors comes down, I'll get a 17" for my main computer, put the 15" on my Falcon and put the 14" there as a docking monitor for my laptop. Now tell me: How could I do that if the monitor was built-in?

If people feel that way, than get another model in the line. You have choices..As for it is a bad idea to come out with an all in one, Apple marketing systems saids otherwise. Compaq and Packard Bell have all in ones now.

>

The people who buy an all in one will most likely not get a 17' one. If you need one you can hook one up as well.

Do atari users get a choice for the keyboard on the ST?

Very well said. There are lots of people who use a computer like a microwave or toaster oven, and have no need or desire to swap innards or monitors - and hell, it's getting to the point where obsolescence mandates everything replaced at once anyway!

The fact that PC makers such as AST and Compaq (others??) have copied the "all-in-one" format indicates that there had to be an antecedent market demand for such products or they wouldn't have been developed. Obviously, they're not for everyone.

Come on, surely you can do better than that?

A Performa 630CD/8/250 would cost you about $2000 in Sweden. I might still
buy one though, to run MagiC on.

If I feel that a company has bad business practices and steals from consumers,
I should ignore it and just not buy the model that I feel is an insult to
the user's ability to choose their own monitor? Yah right.

>The people who buy an all in one will most likely not get a 17' one. If you
>need one you can hook one up as well.

And then do what with the old one? Sell it? Use it on another computer? Tell
me!

>Do atari users get a choice for the keyboard on the ST?

1) You can buy kits that allow you to use an external Keyb on an ST.
2) Keyboards are far cheaper than monitors, so the "waste" of having one
non-used Keyboard is less.
3) Users are much less likely to "outgrow" a keyboard than a monitor, unless
tyhey were suckere dinto buying a non-extended Aple board. ;)
4) Before you mention it, I upgraded the keyboard in my Falcon by adding
the TT touch kit ($10 + my own labor) -- so no mushy feel there!

You see? I've even anticipated your feeble comebacks. Doesn't that show you
that you have nothing to say that we haven't considered years ago and decided
in a millisecond? And you must spend hours agonizing over each post...

I still think it's disgusting. a computer is _not_ a toaster, and never should be!

>The fact that PC makers such as AST and Compaq (others??) have copied the
>"all-in-one" format indicates that there had to be an antecedent market
>demand for such products or they wouldn't have been developed.
>Obviously, they're not for everyone.

If computer hardware and software makers, instead of trying to herd the consumer like cattle and hiding how a computer functions, actually tried to have a computer TEACH the user about how computers work, things would be a lot more efficient.

To draw yet another car metaphor, you have to learn how to operate a car before you drive it, and you even have to learn some simple maintenance. If people didn't know how to do that, they would have accidents and kill themselves all the time.

If current computer and software manufacturers built cars, they'd have about 10 feet of foam rubber around them as crash protection, you wouldn't be able to drive it yourself, you'd just program (or have programmed for you by the dealer) a set of destinations. You'd push one button for where you'd want to go, and the car would drive off in a sort-of linear fashion towards where you want to go. If you hit anything (a house, another car) you'd just bounce around until you eventually get to where you want to go. It would be terribly innefficient, but they'd "fix it" by just making the cars go faster and faster until you didnt' notice.

Personally, I'd rather drive.

>Well, its true. And comes with the two pack in games as well..

Well, you're an idiot. Goldstar 3DOs retail for $349 but you can
get a $50 mail in rebate. Panasonic 3DOs are still $399. The
Panasonic models are the ones most stores in my area carry
(including Best Buy and now Wal-mart). Since Babbage's sold
out of Goldstar units, you can't find them anywhere in my area.

Having said that, are you going to buy one, Pete? I love how
you advocate/bash products you haven't even seen nor owned...

I've been away for a few days. What's new ? Ahhh... Just the usual Sinclap crap.
Yes, you have choice. You have the choice to change the whole computer if you
want a bigger monitor, or change nothing at all. What a choice ! Thank you Mr
Apple. Anyway, if Apple consumers are stupid (and rich) enough to do so, yes,
it's a very good marketing strategy. That's one of the reasons why I'll stick
with Atari, because I don't need anything more than my simple TV. When my old TV
broke, I just had to buy a new one; I didn't have to change the computer or pay
repairs that would cost more than a new computer.

: You make it sound like that the all in one mac is the only model in line up.
: 15' is pretty standard, plus you can hook up another monitor to the Mac. Do
: you use a monitor that is larger than 15'? Considering that the Performa
: 5200/8megs/800 meg hd, 4x cdrom costs $1749 US, you call that price gauging? A
: 14 meg Falcon with 80 meg hd costs $1899 list.

I have looked to the prices and they are (calculated with 1$=1.4DM):
5200/12MB/500MB/CD = 2640$
Falcon030/20MB/540MB HD/CD = 2735$

You must also know, that this Falcon has much more RAM than the compared
Performa and is installed in a Desktop, has a new graphics-card, a PC-keyboard,
and NVDI3+MultiTos.

Oh, it was a wonderful time. Only people who know what they are saying.

: How does the overprice and also ran Falcon compete with the $999 Performa 636
: 8/250/cd with keyboard?

Very easy:

Performa 630/12MB/500MB HD/CD = 2175$
Falcon 030/20MB/540MB HD/CD = 2735$

calculated with 1$=1.4DM. Falcon in a Desktop with a PC-keyboard, graphics-card
and NVDI 3, MultiTos, much more RAM...

Now we know why sinclap never tries to reply on technical merits to posts.
Here's the result:

>> I should ignore it and just not buy the model that I feel is an insult to
>> the user's ability to choose their own monitor? Yah right.

>You mean Atari..Users can choose their monitor.

You make no sense. Apple pushes products that have a trait (built-in monitors)
that I feel is an insult to consumers. It does not matter if they have
products that don't feature that trait, the fact that they have them at all
is yet another reason I don't do business with them. Has it sunk in
yet? Or should I use smaller words next time???

>Use it as a second one, such as publishing and video/multimedia production.
>Many PowerBook users use two screens.

But I want to use it on a different computer! Just like I can with normal
monitors. In fact, can I use it as a monitor for my laptop? No? I can
do that with the monitor for my main computer and the one on my Falcon. hey!
Three computers using only two monitors! WHo woulda thunk? Surely not
Apple, and surely never you.

SInce you were too dumb to understand my original points, I repeat them below
with your random gibberish responses and my clarifications.

>> 1) You can buy kits that allow you to use an external Keyb on an ST.

>But you cannot make the choice before the purchase.

Sure you can. "Mr dealer, throw in the External keyboard kit"

>> 2) Keyboards are far cheaper than monitors, so the "waste" of having one
>> non-used Keyboard is less.

>But you do not have that choice.

I don't? See #1. Read it. Understand it. Or, since it's you, at least try
to know what the big words like "external" mean.

>> 3) Users are much less likely to "outgrow" a keyboard than a monitor, unless
>> tyhey were suckere dinto buying a non-extended Aple board. ;)

>Users decide what monitor they want to use beforehand.

Not if they buy one with a built-in monitor, and it costs much more to overcome
this deficiency by adding an external monitor than it does to add an external

keyboard to an Atari. Of course, you can also buy a TT or Mega, which have external keyboards. There's another choice for you.

>> 4) Before you mention it, I upgraded the keyboard in my Falcon by adding
>> the TT touch kit ($10 + my own labor) -- so no mushy feel there!

>But what about the non technical public?

Have the dealer install it for $25. Duh.

>Your reasoning is typical of a Atari marketingdroid.

At least it's reasing. Much better than the "let's spill my alpha-bits on the floor and see what words they make" way of composing a post.

>Why not?

Read what I wrote just below that! Unlike you, my paragraphs actually relate
to one another and an idea mentioned early on is explained later. I know,
it takes brains to understand it. You're used to baloon help.

>In what way? Typical arrogant computer science dweeb who thinks he's Know's
>best.

Have you heard the old wise saying that goes something like: give a man a meal
and feed him for a day. Teach him to farm and feed him for a lifetime.
I know you are afraid of knowledge. Its presence only magnifies your own
imbecility and feeble attempts at life. However, by rejecting learning you
only further imprison yourself in your ignorant shell of a world. The only
true path out is to accept your stupidity and grow beyond it.

>Exactly true for a PC. Simple maintenance. But you have gooten off tract.
>What does this have to do with the all in one?

I have gotten off track, yes. I am speaking more generally. Can you
think generally? Or can you only comprehend the facts that you've already
swallowed because your mind is lodged at the other end of your digestive
tract?

>Your logic is flawed. What does this have to do with the all in one?

I'm speaking in general of the "let's package everything together and
shield the user from as much as possible" philosophy. It applies to the
all-in one design (let's remove choices, such as monitor, from the user's
ability) Operating systems, etc.

Don't forget that the 5200 is a PowerMac with a 4x cdrom, while the Falcon is
still 16 mhz 030.

The 5200 in the USA costs $1748. The PowerMac 7100/8/700/cd has been reduced
to $1569..

> Falcon030/20MB/540MB HD/CD = 2735$

Still a ripp off! Why would anyone invest close to $3000 for an 030?

As for memory, say ram doubler!!

You would not do business with them if the all in ones did not exist. The all in one came into existence because of the content of Apple's marketing research. Why would Apple give a dam about what you think. Obvious the all in ones have been a great success. Considering that the Millwaukee public school system has bought 3000 of the 5200's, your antics has zero substance.

This thread is getting stupid. I don't think that offering users the
opertunity to buy built-in monitors is a scam at all. What happens if the
user can just affort the cheapest piece of performa junk lying around
and having an integrated monitor saves him a few bucks? What happens
if you are setting up a lab and you need the least expensize, secure
and maintainable setup possible?

sinclap2954@cobra.uni.edu wrote:
: > I have looked to the prices and they are (calculated with 1$=1.4DM):
: > 5200/12MB/500MB/CD = 2640$
: Don't forget that the 5200 is a PowerMac with a 4x cdrom, while the Falcon is
: still 16 mhz 030.
: The 5200 in the USA costs $1748. The PowerMac 7100/8/700/cd has been reduced
: to $1569..
: > Falcon030/20MB/540MB HD/CD = 2735$
: >
: Your kidding?

No kidding. And the CD-Rom is also a 4x cdrom.
So and AFAIK the 5200 has only one videomode which can be used seriously (I
mean with a frequency of at least 72 Hz).

: > You must also know, that this Falcon has much more RAM than the compared
: > Performa and is installed in a Desktop, has a new graphics-card, a PC-keyboard,
: > and NVDI3+MultiTos.
: Still a ripp off! Why would anyone invest close to $3000 for an 030?
: As for memory, say ram doubler!!

100 $ more for 6 MB more ? I think that isn't bad. Just look how much 6MB would
cost for the 5200 (if it is possible without removing the old SIMMS). So how
much do you need to spend to upgrade to 20MB too ? And after that compare the
prices again. OK the 5200 is a PPC and the Falcon only a 030, but have you
seen so far software which is _using_ the DSP ? That gives much speed !

>>> 1) You can buy kits that allow you to use an external Keyb on an ST.

Have you ever USED one of these adaptors..?

I received a DEKA keyboard adaptor for the purpose of writing a review of the unit for Atari Interface magazine.

Out of four IBM keyboards I had on hand, the unit only worked with one of them at all, and had various other problems.

I declined to do the review and sent it back to the magazine.

I don't consider flaky third-party addons to be giving the customer a "choice".

I love Archon! Esp. Adept, although I play it still (and Blue Max and Fort Apocalypse), It is actually on a Commodore 64. Anyway to the point, Atari has always engineered quality computers, If you compare an Atari Falcon board to a PC mother board, the Falcon is plainly of a much higher quality in its construction.
Atari came out with the Falcon in about 92 ? I could be wrong, my Falcon was made in may 93. It is essentially a fully equipped multi-media personal computer based on the 68030 (or higher with upgrades) processor and Atari's TOS /GEM operating system built in (GEM is a derivation from the original graphical user interface by XEROX and provides a visual, mouse-driven interface that costs almost no RAM as its routines are ROM resident, although tons of Bootable extensions are available. The programmable resolutions, CD quality sound, multiple game ports, SCSI host adapter, MIDI interface, Digital signal processor, DMA architecture, and internal IDE interface, LocalTalk Lan adapter, all come stock in every Falcon. Software for any purpose can be found via mail-order. The tragic part of the Falcon is that most people buy PC's that can do what they don't need and can't do what they really want, so most of the development and marketing of software takes place in the PC Compatible world, even though the Falcon is really the ultimate consumer computer and costs much less than a PC with all the same card options. Ofcourse processor speed is literally a function of sales volume in the computer world and although my Falcon runs a 16MHZ, I find that more efficiently coded software actually runs plenty fast enough. Third party accelerators are available boosting speed to around 40MHZ, which really looks much faster on a Falcon than 66MHZ looks on a Windows hung PC. My Falcon has 4 Meg Standard memory, again upgradeable to 16MEG where 2MEG are preassigned to VIDEO. Atari has licensed the Falcon design to several third party manufacturers who are producing units optimized for such specific purposes as Digital Direct to Hard Disk recording.
I have no complaints about the Falcon, only about an uneducated market that buys like drones rather than discriminating customers. It is sad that one of America's great home-computer manufacturers is now the maker of an "Alternative" computer, but a fine alternative it is.

: I've never heard of a Falcon, what is it?

The last Computer Atari ever made. It was supposed to be the
first in the next generation of Atari ST machines, but the line was never
continued. Atari realized that they couldn't survive on a proprietory
system, especially when the fierce battles in the clone market were
causing prices to fall below Atari's ... and they used to undercut
everything.

The Falcon was like the ST, but with better graphics, faster
speed, a more powerful processor, a digital signal processor for sound,
and multitasking capabilities. It was generally compatable with ST
software. Only the 030 Falcon is available. Atari did show a prototype
040 machine a few times, but it was never manufactured.

: I used to own an Atari 600XL and an 800XL years ago, my first
: computers- they were great.

Yep! I had a 130XE until it died this summer.

: Anybody remember Archon, Blue Max or Fort Apocolypse?

Fun games ... especially liked "Fort Apocolypse." Must have had
thousands of games for that machine.

That's exactly the way I feel about the discussion about the all-in-one Mac.. obviously someone must be buying them or Apple wouldn't continue to make them.

There's a lot of attraction to a system that doesn't have a lot of separate pieces and wires hanging out all over the place. A system like that is probably a lot less intimidating to a first-time computer user, which is a very GOOD thing for a lot of people..!

How do you get 20MB into a Falcon? The max is 14MB, no?

>P.S. Please stop quoting signatures.
If you kept yours to a reasonable length, it wouldn't matter so much.

Some advice from Emily:
Q: How long should my signature be?
A: Dear Verbose: Please try and make your signature as long as you
can. It's much more important than your article, of course, so try
to have more lines of signature than actual text.

Try to include a large graphic made of ASCII characters, plus lots of
cute quotes and slogans. People will never tire of reading these
pearls of wisdom again and again, and you will soon become personally
associated with the joy each reader feels at seeing yet another
delightful repeat of your signature.

OK, you just changed our debate about integrated computers into a mac versus
PC argument. I'll just ignore the first two sentences and not rise to the
bait. You are always goint to pay someone to design the case unless you
buy your own and I'd much rather pay someone to put it all together for
me than do it myself. If such a magic box was for sale then most people
would buy it. I don't want to think about my tools, I want them to do
something for me. Every computer does some pandering. If you want you
could poke ever instruction into your computer manually but you are
either "lazy" or "stupid" so you don't. I personally perfer having
a computer that comes with an operating system, a VCR with on-screen
programming (and a remote control) and a cordless phone. I guess I'm just
lazy and stupid.

Oh yeah? Mention "Macintosh" around Ford Research Laboratories, and all
you get are peals of laughter. Yes indeed, Sinflopper, not a single

a LOT of $$$.

So HA HA HA, Sinflop.

What do you mean backtrack? Apple keyboards still have the Option and Command
keys, as well as Control. As for all-in-one machines, not only has apple
not backtracked (they still have at least two all-in-one models still on the
market) but other companies have released all-in-ones as well.

What a double-standard! You're willing to forgive other companies, but
not Apple! How is such a statement any different from what Peter Sinclair
says?

Your argument a few articles ago was that Apple is insulting its users by
offering a machine with a built-in monitor. How is Apple insulting its users?
If they want a different model, all they have to do is buy it! Have you even
seen the Performa 5200, before making a judgement that its built-in monitor
is bad?

>640k will be enough for anybody.

That's different.

First of all, while programs continue to demand more and more memory, they
don't demand bigger and bigger monitors. Secondly, I'm not saying that a
15" monitor is enough for everyone. I'm saying that an 832x624 15" monitor
will be enough for anyone who buys the Performa 5200. People who buy the
Performa 5200 *know* what they're getting -- and the kind of people the
Performa 5200 is aimed at are the kind of people who don't want to do the kind
of things that require more than 832x624. People who want more than that
will also want a faster machine.

>yet? Or should I use smaller words next time???

So I guess you'd never buy any computers from Compaq or Packard Bell -- or
even IBM? All of those companies either have now, or at one time have had
computers with integrated monitors.

There are two points I think should be made:

Anybody who doesn't want the 5200's integrated can buy the 6200, which is
almost exactly the same machine, except for the case and I believe the hard
drive size. If you don't want a Mac with an integrated monitor, then don't
buy one with an integrated monitor. It's as simple as that.

There's is no difference in my mind between an integrated monitor, and an
integrated keyboard. Just as you claim that an integrated monitor is
limiting in that it's a waste if you want to upgrade to a bigger monitor,
an integrated keyboard is also limiting. With an integrated keyboard, I
can't type on my lap, I can't move the keyboard around wherever I want, and
unless I want to spend extra money, I can't change the keyboard. With the
Macintosh, you can choose your keyboard before you purchase the machine and
you don't end up with two keyboards, one unused -- just as you would end up
with two monitors, one unused, if you wanted a bigger monitor with your
Performa 6200.

(To be fair, though, the Performa 5200 is not aimed for the kind of people
who would want to upgrade to larger monitors. It's aimed for home users; the
kind who would be satisfied with 832x624 on a 15 inch screen. Anyone who
who wanted a bigger monitor would no doubt also want a faster machine than
the 5200.)

>>Users decide what monitor they want to use beforehand.
>
>Not if they buy one with a built-in monitor, and it costs much more to overcome

As I said above, Apple offers a similar machine, without the inegrated monitor.
It's your choice.

(No, I am not flaming you, and no, I am not trying to convert you to the Macintosh. I would appreciate not being flamed back.)

Get PCs. The all-in-ones are more expensive then comparable stand-alone
machines. You are paying for the new case design, the menufacturer
putting it all together for you, etc. It panders to the mentality of those
who want to buy a magic box that does everything they want without them ever
having to think. I don't agree to such pandering, and think that any company
that does is preying on the general stupidity and laziness of the public for
their own profit.

True in Sinflop's case, but not always. I'm doing summer classes so I can
get the equivalent of five years fo classes done in four. Actually, I planned
on graduating in three, but I've decided to take it easy and do it in four.
This way I can take more classes outside my major, like Japanese, which I'm
starting in the fall.

I'm not entirely sure what you mean -- they added what later "to be
compatible?" The Option and Command keys? The Command key was present in
the first Macintosh. I think the Option and Control keys were added later.
If that's what you mean, then I believe you are correct.

I understand perfectly well that you have your list of things you don't like
about Apple, and that you won't buy an Apple until all the items on your list
are resolved. I also understand that you argue that it's cheaper to buy a
replacement keyboard than a replacement monitor -- but you haven't answered
my question. How is Apple insulting its users? It's not forcing them to
buy models with integrated monitors.

>>First of all, while programs continue to demand more and more memory, they

There is no current Mac software out there which requires more than 832x624
resolution that I am aware of. Most programs don't required any specific
resolution at all.

Anyone who doesn't want a machine like the Performa 5200, which is clearly
an entry-level model, is free to buy any Macintosh they want, and to choose
the model of Macintosh that best suits them. Apple does not force them to
buy models with integrated monitors.

>So what if the user HAS NO ability to choose their own monitor..?

>What if they don't know anything about "DPI" or "pixels" or "Horizontal
>Scan Rates" or "MultiScan"...?

Do you walk into a car dealer and say "I want a blue one. I don't know or
care about anything else" Or into a real estate office and say "I want a
hpouse with pointy rooves. I don't know anything about square footage or
number of bathrooms"

It's the same thing. Computers are part of the world, and to be ignorant of
how they work is a tragic crime. For a company to foster and encourage
ignorance is downright despicable.

>What if all they want is a simple, easy to purchase unit that doesn't
>require them to become rocket scientists just to buy a computer..?

The point is, it doesn't require it! People have this image, helped along by
companies such as Apple, that computers are "too complex to understand" and
"too difficult to use" -- all lies.

>What if they don't want all the wires and boxes and hassle that separate
>components entail..?

Then they surely shouldn't be trusted to buying anything. Did you know that
a TV has wires? and a VCR too? How about the much-vaunted toaster? Did
you know that you have to PLUG IT IN? and CLEAN IT occasionally? my god,
it's so complex! Someone should make an easier toaster!

>(Do you crusade against integrated stereo systems too..?)

Sigh. Has everyone on this group lost their ability to think?
I'm not "crusading" -- As a consumer, I have the right to choose not to deal
with a company that has business practices that I don't agree with. It's part
of the whole Capitalism thing. I have a mental list of over 100 items that I
fault Apple computer for. Integrated desktop computers is just one item on the
list. I therefore choose not to deal with them. Am I telling you to not
buy one? No. Go ahead and do it. I still feel that Apple is wrong in
marketing them, and Will not do any business with them for so long as they do
(among, as I said, many other reasons)

As for stereos -- For portability reasons, "boom-box" integrateds work.
When I eventually decide that upgrading beyond that is in my plan, I certainly

will not be looking at cheap poor-quality "integrated" stereos. I will buy each component separately and for the features that I want.

>There are Good Reasons for buying an integrated computer system.

Name one, and I mean just ONE good, _INTELLIGENT_ reason why I should want to buy an integrated system.

>I'm not entirely sure what you mean -- they added what later "to be
>compatible?" The Option and Command keys? The Command key was present in
>the first Macintosh. I think the Option and Control keys were added later.
>If that's what you mean, then I believe you are correct.

I mean this:

First macs: Instead of the standard PC and everyone else "Control" and
"Alternate" keys, had "Command" and "Option" -- functioning in much the same
capacity, respectively. In fact, the little symbol for "Command" was chosen
because it didnt' mean anything except "Campground" somewhere in Europe. They
wanted to be "Different" than PCs to appeal to those who were jaded with the
whole PC environment.

Later Macs: After realizing that they actually needed to communicate with
other computers, (most noticeably on-line) "Control" "Alternate" and "Escape"
keys were added. Of course, they continued to switch them around, swap
ESC and ~ on every model, only give you function keys on extended keyboards,
etc.

So, the question is this: Did Apple abandon their uniqueness in order to be
compatable, therefore giving up their original vision and selling out? Or
were they foolish to believe that they could have any impact against the
weight of the PC dominance? You decide.

Okay, one more time. (This is your brain on drugs?)

There si a segment of the population that knows nothing about computers.
They probably don't need them anyway, but hey, I'll be nice and assume that
for some arcane reason they do. There are two options:

1) Educate them on what they need to know about computers so that they can
make an intelligent, informed purchase decision.
2) Offer them some "miracle" panacea computer that they can buy without
thinking and continue their ignorance. In fact, it comes with an OS that
requires no brain. Sure, if you ever do learn about how computers work, you'll
realize that the machine probably isn't what you want, and it ends up being
painful to do certain things (like upgrade a monitor, eject a floppy manually,
force a move across volumes, trade floppies with the rest of the world who
uses PCs -- don't give me "Use Apple File Exchange", it's junk)

I believe that everyone is capable of knowing enough about computers to make
an informed decision (except perhaps sinclap, but he's a rare medical case)
and that Apple, by making #2 their corporate mission, is equivalent to
snake oil pushers who prey n the ignorance of the public. In addition, they
seem to want everyone, including those who CAN make intelligent decisions,
to buy their product, broadcasting a clear message that EVERYONE is too dumb
to know how to use a computer. And I, as not only one who likes to make
such informed decisions, but also as one who believes in the pursuit of
truth, find that insulting.

Have I made myself clear yet???

>There is no current Mac software out there which requires more than 832x624
>resolution that I am aware of. Most programs don't required any specific
>resolution at all.

Sure, but if you want to have multiple windows open & such, it's really
cramped. Heck, I run at 1024 x 768 and I find it cramped for multitasking.
I can't have more than one or two windows open before things start really
overlapping and becoming hard to see.

>Anyone who doesn't want a machine like the Performa 5200, which is clearly
>an entry-level model, is free to buy any Macintosh they want, and to choose
>the model of Macintosh that best suits them. Apple does not force them to
>buy models with integrated monitors.

And once again, I must reply that It doesn't matter what else they offer.
Because they offer the option that I find insulting (and this is leaving out
any arguments about the OS, whose entire purpose is to make the user feel
stupid and incompetent and ships with every mac) I cannot overlook that and
say "Well, they only rip people off on SOME models..."

Yes, Cindy got on me about that one. She just graduated this
semester (and she did put in two summer semesters). I should have
chosen my words more carefully. Also, I actually have several
relations living in Iowa. The farms there are beautiful.
Hummmm, farms? Sin_Plop? Kinda fits.

Such a user should try to get a few information. When you plan to buy something,
don't you try to get any advices ? Don't you try to see which product fits better
your needs, even if you have to learn a few technical concepts ? If the future
user is too lazy to make a choice, he won't get what he needs but what the dealer
wants to sell him.

You must confuse "too dumb to know how to use a computer" with "not informed enough to understand how a computer works". Apple tries to offer users the possibility to use their computer without really knowing how it works. This point doesn't make a big difference with Ataris, but surely with PCs.
Pascal.

That's right..! Just like that goddammned McDonalds who sells ready-to-eat hamburgers instead of offering the customer the choice of what brand of pickles they want on them, or who the buns were made by.

Not to mention Levi Strauss who doesn't even give you the choice of what gauge thread you want your bluejeans sewn together with..!

And believe it or not, AT&T forces people to use telephones with NO choice of whose chips are inside, or even how big the buttons are going to be..!

It's hard to believe the public is so stupid and lazy as to stand for this outrage..!

Why, I even bought a car with its engine already installed and everything.. and it was the one offered by the manufacturer.. I couldn't put the car on the floor and the engine on a table...

I feel so stupid and lazy for letting them do that to me.

I just wanted a magic box to get me to work and back.

Actualy, summer sessions provide a kind of solitary or so. Sure is peaceful
without the freshman polutting things.

As for my mother, I beg your pardon.. As for Iowa, keep it up. I don't want
the secret to be known and have the state become another California..

>> Who is Miss. Rosey

Chrissy, what about the ST owners who got swindled. Can't even expand past
four megs and upgrade the cga graphics.. Like the Nintendo lawyer said, Atari
competed on the cheap.

When will Atari make it right? When will Atari advance the ST line? Looks like
the Jagflop will become another LYNX and PORTFOLIO!

One video mode. The 5200 and my 630 has video slots for expansion..

>
> : > You must also know, that this Falcon has much more RAM than the compared

The Falcon comes standard with four megs. You have obvisouly have expanded it
on your own. I can ad inexpensive 72 pin ones with ease..

Who the hell cares about this NVD13+Multitos...Get with the picture...

> : Still a ripp off! Why would anyone invest close to $3000 for an 030?

Why would I need 20 megs? The 5200 has sim sockets to add inexpensive ram. An
8 meg sim will cost you around $300 in the USA. Hell I have ram doubler!
Ataris flagship is still an 030!!

>Yeah, damn those NeXT cubes. Obviously they are junk too.

Designed by Jobs, of course. Why do Mac advocates think that everytime we say one thing of many that we dislike about the mac that somehow that's our entire list and they argue that one point to death instead of saying something useful like: Okay, you have your reasons for not liking macs. I won't try to change you.

Yes NeXTs have the funky eject mechanisms. Of course, they have a much better OS than the Mac and can therefore be overlooked in favor of the advantages. Well, then again, NeXT hardware is defunct, so NextStep on a PC doens't have the eject problem... heh :)

Guess real users didn't like it.

Just rambling randomly,

~Chris

I use the phrase "too dumb" to sarcastically describe my view of Apple's
management/marketing strategy. I personally believe, as you, that it is a
matter of information and that nearly everyone has the ability to use and
understand a computer given the proper info.

Did they finally add that in sys 7.5 and up? You had to use a special program
(not by apple) to do it on 7.1 and before. Shows that some things do change.

Of course, there's still a hundred other reasons not to use a mac left... ;)

The all in ones are not expensive, Chrissy? What is your point? Apple's marketing has said otherwise. Unlike a certain company, Apple is a 10 billion firm that use to be on equal footing with Atari.. Look what happen to Atari..

> solution (buy an external keyboard or buy an external monitor) is cheaper?

Duh...

Assuming the computer user is smart enough to be able to breath unassisted,
they'd BUY A COMPUTER MODEL THAT WOULD FIT THEIR NEEDS.

IE: If they want to put the computer on the floor, and the monitor on the
table, they'd buy a computer that's separate from the monitor... Duh..

If they'd rather not have all those wires and plugs and separate boxes,
maybe they'd buy an integrated system.

What's so hard to figure out about that..?

1785. Re: What is a Falcon?

Newsgroup: comp.sys.atari.advocacy
Date: 1995-06-17 00:00:00 UTC
From: BobR <76702.1466@CompuServe.COM>
Message-ID: <3rtp85$s07$7@mhadf.production.compuserve.com>
Source record: 12334

> I've never heard of a Falcon, what is it?

The Atari Falcon030 was an aborted attempt by Atari at upgrading their computer line. It took them so long to bring it to market that it was essentially obsolete when it first appeared in the stores. It was never advertised to any extent and production was very low. It was on the market for a relatively short time before Atari ceased production of all computers.

The Falcon design has been licensed by C-Lab in Germany, who is now producing small numbers mainly for the music industry.

It has several strong features which lend itself to use in music production, although its relatively high cost makes it difficult to use in nearly all other applications. Also there is little native mode 68030 software available for the Falcon, although it does run a lot of the older Atari ST software. Very, very little new software for any Atari computer is being produced currently.

The Falcon030 was a good design which could have been fairly successful if only it had been brought to market in a more timely fashion and supported by the company which made it.

Neither of these things happened, and the precipitous drop in prices of equivalent and higher powered IBM and Macintosh models made the Falcon an overnight "niche" player.

> Anybody remember Archon, Blue Max or Fort Apocolypse?

And M.U.L.E., and Repton, and Seven Cities of Gold...

Those were the days...!

Source record: 12335

> Personally, I'd rather drive.

But you don't have to know anything about how carburetors work in order to drive... you don't have to know the difference between throttle body fuel injection and port injection to get to Grandma's house.

You don't need to know what SAE oil ratings mean, or how Octane ratings are calculated...

Likewise you don't need to know how many dots per inch your computer monitor has, or whether the video card is on the motherboard or is a separate board in order to write a Pulitzer Prize winning news story or a New York Times Bestseller novel...

You don't have to be a computer geek just to compose a hit song on a computer, or have 10 pens and pencils in a pocket protector and know where all the wires on the back of a computer go in order to do multi-media presentations for your company.

You're espousing the idea that everyone who uses a computer HAS to be a "backyard mechanic" and change their own oil and reline their own brakes, or they're too dumb to breath.

The automobile you want people to drive is a "kit car" you have to assemble in your garage... one where you have to obtain a Ford Escort rear axle from one salvage yard and a Chevy Camaro front end from a different yard, and a Chrysler engine from somewhere else (left up to the "driver" to locate).

Most people don't NEED to know their cars that intimately, nor do they NEED to know their computers that way either.

A computer CAN be an "appliance" for users who want it that way. Why force them into learning to be a computer nerd if they don't want to..?

BobR

> The one you boight the computer from, silly! Duh... There's four or five
> within a few hours drive from me, and many either of us could mail-order
> from.

There are four or five *ATARI* dealers within a few hours drive from you..?

I didn't think there were five Atari dealers left in the entire USA.

(Then again, it depends on how you define "a few hours"... I could drive to
Toad Computers in Maryland or MidCities Computers in Ohio, or B&C in California
in "a few hours"...)

California is a "special case"... the rest of the US has very little choice
when it comes to buying Atari or third-party Atari products.

And a lot of people aren't comfortable ordering "big ticket" items through
the mail, from a dealer they've never done business with, and not being able
to see the product before buying it.

So not only are you forcing people to become computer nerds when they might
not WANT to, you're forcing them to drive "a few hours" to buy a computer,
or buy one sight unseen through the mail.

Hmmmm...

The Falcon was a multimedia computer with out the apps!! Correction, the
Mac/PC's are multimedia machines..

> and Atari's TOS /GEM operating system built in (GEM is a derivation from
> the original graphical user interface by XEROX and provides a visual,

> less than a PC with all the same card options.

Thats a bunch of BS..The Mac/PC platforms cost much less than a Falcon set
up..The Falcon is not the ultimate consumer machine. Please define how the
Falcon is the ultimate consumer machine? I suppose you have not kept up with
the consumer oreinted hardware/software on the other platforms?

> Ofcourse processor speed

> is literally a function of sales volume in the computer world and although
> my Falcon runs a 16MHZ, I find that more efficiently coded software
> actually runs plenty fast enough.

Another myth that the falcon only has more efficiently coded software? Please specify and list the efficiently coded software. Gee, ClarisWorks and WriteNow are not efficiently coded?

> Third party accelerators are available
> boosting speed to around 40MHZ, which really looks much faster on a Falcon
> than 66MHZ looks on a Windows hung PC. My Falcon has 4 Meg Standard
> memory, again upgradeable to 16MEG where 2MEG are preassigned to VIDEO.
>

For the price of a third party accelerators, Multimedia Mac/PC's can be had..

Atari has licensed the Falcon design to several third party
> manufacturers who are producing units optimized for such specific
> purposes as Digital Direct to Hard Disk recording.

What about the rest of the market?

I have tried to locate a Falcon, but with no luck. I have read the specs and reviews on it. The Falcon could have been with Atari's nurishment. I am sure that a expanded Falcon with Cubase will put my unexpanded low cost 636 to shame. But I have a cdrom and can play DarK Forces!

My point was that NeXT users are usually experts and most NeXT users like
software eject. So software eject isn't necessarily the choice of morons.

And why do we argue about anything? Because this is advocacy. We could all
say, "you like this and I like that so let's not argue" but then there
would be no posts to this group.

I know enough about the ST line since way back in '85'. Again what about the
wedge shaped ST and Falcon line? You can't put the keyboard in your lap.
Again Atari doesn't give you a choice acording to Chrissy's logic..

Calamus SL is not upto snuff compared to the industry standard. Plus, why
would anyone, I mean a professional run it off Atari's top of the line 030

machine?

I don't see any problem to communicate with the rest of the world.

: > There's four or five within a few hours drive from me, and many either of us
: > could mail-order from.
: Few hours? To me, would be days to locate a ST dealer if one exist! Dying
: breed.

It might be a _your_ problem to find a dealer.

: Again, what dealer?

I know lots of dealers. I can mail you the adresses if you want. (But I think
you don't really want them).

: Chrissy, what about the ST owners who got swindled. Can't even expand past
: four megs and upgrade the cga graphics.. Like the Nintendo lawyer said, Atari
: competed on the cheap.

First the ST's to which you refer are 10 years old. The newer ones (like TT or
Falcon) are easier to upgrade. And second with the Multiboard you can have up
to 12MB on a ST and a ET4000 graphics card.

: > So and AFAIK the 5200 has only one videomode which can be used seriously (I
: > mean with a frequency of at least 72 Hz).
: One video mode. The 5200 and my 630 has video slots for expansion..

Again you must buy an extension. Add the costs to your prices.

: > : > You must also know, that this Falcon has much more RAM than the compared
: > : > Performa and is installed in a Desktop, has a new graphics-card, a PC-keyboard,
: > : > and NVDI3+MultiTos.
: The Falcon comes standard with four megs. You have obvisouly have expanded it
: on your own. I can ad inexpensive 72 pin ones with ease..
: Who the hell cares about this NVD13+Multitos...Get with the picture...

No. The Falcon I'm talking about are the Falcons that you can buy from dealers.
They are not the original ones because they have been upgraded and put into
a desktop or Tower _before_ you buy them. I have compared these models in the
way, in which they are selled. OK you can add simms. But to compare the
computers then, you must add the costs. The RAM is inexpensive, but it doesn't
cost 0$.

: Why would I need 20 megs? The 5200 has sim sockets to add inexpensive ram. An
: 8 meg sim will cost you around $300 in the USA. Hell I have ram doubler!
: Ataris flagship is still an 030!!

First you need much RAM if you want to make DTP (you state it is one of the
serious things). The pictures are taking much RAM. And there is it what I have
said before. Add the costs.
BTW (really serious question) what is RAM doubler ?

You should compare the computer with similar equipment. So I made the choice
to look at 12MB and 500MB HD. That was also the reason why I have added the
price for a 4xcdrom and not for the cheaper 2xcdrom to the Falcon. So I added
a similar equipment to give the Performa a fair chance. What are you doing ?

: > : So what apps do you run?

I never said YOU should buy an integrated system... no one here has said that.

If you want to boycott Apple Computer, Inc. for making integrated computer systems, fine... that's your choice.

What I DID say is that "There are Good Reasons for buying an integrated computer system."

I've already named several, and so have others here, so I won't waste time and bandwidth repeating myself.

You don't like them, great... I think we've all realized that by now.

>Eh? What makes you think people are ignorant? Just flip on the switch and load
>the apps.. Or is it something else?

I worked for two years supportinf Mac software. People are ignorant.

>What do you want them to understand?

Basic things, like why the computer needs to be on before it can work. Why
you need to upgrade software to get new features. The basic mechanics of why
the computer isn't a magic wand you wave over your work and it does everything
for you. I could go on...

>Exactly with one plug..The all in ones have one plug. It's the one plug
>concept, Chrissy.

Oh yes, the number of power plugs is the #1 deciding factor eh? Is that your
point??

>Such arrogance Chrissy.. Apple is not wrong and the market has said soo. If
>Atari responded to the market, the Tramiels would be billionaires. Quit trying
>to impose your rightous attitude in what you think is best for people and worry
>about yourself.

The market has said what? I'll tell you. Apple has a 10% market share and is
barely holding on to it. With the p6, powerPC clones and Win9x, Apple as an
OS provider had better be in panic mode or they're on the way out.

It's often the crutch of the incompetent to call those who think for themselves
"arrogant" -- I expected no less from you.

>> Name one, and I mean just ONE good, _INTELLIGENT_ reason why I should want
>> to buy an integrated system.

>Space...

Hm. Did you know that if I put a deskytop machine under a monitor it takes
up no less space then an integrated one? Nice try. Here's your Rice a Roni
as consolation prize.

: I know enough about the ST line since way back in '85'. Again what about the
: wedge shaped ST and Falcon line? You can't put the keyboard in your lap.
: Again Atari doesn't give you a choice acording to Chrissy's logic..

Of course we have choices, there are store out there that sell Falcon
(home made) with a detachable keyboard. Or the user can just add an
interface and they can connect any IBM compatible keyboard. At least
ATARI give the user the keyboard to the user to type, we don't have to by
a keyboard unlike you mac user.

I see...

So that means you'll never buy a computer from Atari Corp..?

They made an integrated monitor/floppy drive unit early in the life of the
ST line.

You DO stick to your principles, don't you..?

Oh.. I see.. that's different.

Hmmm

>
>Again you must buy an extension. Add the costs to your prices.

That's true. This used to be a much bigger problem than it is now, because of the few options in the Mac product line (stemming mainly from the "keep it simple" philosophy of Jobs). Now there's so many Macs to choose from that not even the product managers know how many there are. I think that others have made good points here - if the user feels that s/he will need a larger monitor in the future, then the option is readily available at purchase time. However, the all-in-ones offer a nice system price break and certain advantages.

>[Falcon argument deleted]
>First you need much RAM if you want to make DTP (you state it is one of the
>serious things). The pictures are taking much RAM. And there is it what I have
>said before. Add the costs.
>BTW (really serious question) what is RAM doubler ?

I agree. Extra RAM is always good, and with the new RISC PowerMacs, app sizes are increasing.

RAM Doubler is an interesting product for the Macintosh that effectively doubles the amount of RAM available. This is done in a manner similar to that of Stacker for the PC (but in RAM, not in disk space). RAM segments are decompressed on the fly. I'm using it right now, because Microsoft apps are so incredibly huge... *sigh* Anyway, I'm not fully enlightened on exactly how it works, and I'm sure its developers want to keep it that way, because they're making a killing. Oh - and every application can only use 40% of the total RAM-Doubled memory total, so that the physical RAM won't overflow with data. Interesting product.

A previous poster asked for the advantages of an all-in-one Mac/Computer.
* Portability - And the obvious rebuttal is "get a laptop". Well, there are certain occasions when you want to move your computer, take it somewhere, whatever. When you only have one box, keyboard, mouse, and a couple of cords, life is _much_ easier. This is why the original Macs had handle cutouts on the top (that I've used many times).
* Asthetics - Compugeeks don't usually think all-in-ones look cool (including me) but they do look pretty sleek. I have an old Mac IIx, and there's cables all over the place. Same with this PowerMac. I don't mind, but some do. Wire jumbles are a pain when you just want to plug in a CD player or

something, and you have to dive through a cable jungle
to get there.
* Price - Hey, it makes sense. One power supply + one box + volume
equals less money for the consumer. For the type of person
that Apple is aiming for, price is a major factor.

I've used Macs since 1984. I also use Unix regularly. I don't consider
myself ignorant of computers in any way (except for the Atari product
line, which I'm not very familiar with). However, I choose to use the
Macintosh because it makes the computer a tool, not an obstacle. Also,
when I want to do something, I figure the computer should to work to
make life easy for me, not the other way around. Many people don't
agree, and that's why there's more than one computer platform around
(and I have a lot of respect for Atari owners and I hope to own an old
ST soon).

It's just a different perspective. I _like_ the fact that the disk ejects
automatically. I don't want to have to tell my computer that I've put
a disk in or taken one out. I figure that's its job. I like the way that
it thinks ahead and turns off options that I shouldn't be able to use.
I should know that I can't use certain stuff, but I can be absent-minded
like anyone else.

The Mac isn't a panacea of ease-of-use. It has its quirks. But I like
it, and I'll live with it.

>care about anything else" Or into a real estate office and say "I want a
>hpouse with pointy rooves. I don't know anything about square footage or
>number of bathrooms"

I think that's a little extreme. There are many people who walk into
the dealership and have requirements of color, price, reliability and
test drive. They talk to their friends about reliability, then they
drive the car. If it's the right color and right price, they take it.
I know a particularly rich woman who bought a nice station wagon in
about 5 minutes, and didn't even drive it first. She isn't stupid,
but cars just aren't that important to her. Being uneducated does
leave the consumer open to being swindled, but by including friends'
opinions into the equation, that possibility can be slimmed down.

When people buy cars, how many really know what throttle-body
fuel injection is? How many truly understand the difference between
a V6 and a horizontally-opposed 4? To take it even further, how
many people you know _truly_ understand what the octane number means
on the gas pump ("better" doesn't cut it here)? I think there are a
lot of people that are somewhat car-ignorant. I don't think that's
so bad.

>It's the same thing. Computers are part of the world, and to be ignorant of
>how they work is a tragic crime. For a company to foster and encourage
>ignorance is downright despicable.

Cadillac recently introduced the Northstar system, which allows 100,000
miles between scheduled maintenance. Does this not also "foster and
encourage ignorance"? There are a great many things in this world
to use and possibly understand. Imagine if I was only allowed to use
those things that I fully and completely understood. Imagine how
lost I'd be! Imagine all the people that would never be able to use
CD players, tape players or record players!! I don't fully understand
my microwave, but I use it. I don't think that's a crime.

>>What if all they want is a simple, easy to purchase unit that doesn't
>>require them to become rocket scientists just to buy a computer..?

>
>The point is, it doesn't require it! People have this image, helped along by
>companies such as Apple, that computers are "too complex to understand" and
>"too difficult to use" -- all lies.

Clarification - Apple would like you to believe that all computers other
than the Macintosh are "too difficult to use". Possibly a stretch, but it's
the foundation of their marketing strategy which I happen to agree
with. I personally enjoyed the commercial with the family trying
to set up a PC before Christmas, and staying up all night. Apple
tries to make computers that people don't have to fully understand
to use.

>Then they surely shouldn't be trusted to buying anything. Did you know that
>a TV has wires? and a VCR too? How about the much-vaunted toaster? Did
>you know that you have to PLUG IT IN? and CLEAN IT occasionally? my god,
>it's so complex! Someone should make an easier toaster!

Have you ever seen a TV/VCR combo? They used to be hot sellers.
How about the "scandal" that thousands of homes across the country are
illuminated in the night by a lone, flashing "12:00"? There are
a great many people that don't understand how to hook up a VCR to a TV.
Is this causing a degeneration of society?

How about the World Wide Web? I've been on the 'net for about 5 years
now, and it used to be that you had to memorize the names of each
individual site you wanted info from, then ftp it. Now you just
use WWW and point and click. Is this also a crime?

>>(Do you crusade against integrated stereo systems too..?)
>
>Sigh. Has everyone on this group lost their ability to think?
>I'm not "crusading" -- As a consumer, I have the right to choose not to deal

>item on the ist. I therefore choose not to deal with them. Am I
>telling you to not buy one? No. Go ahead and do it. I still feel
>that Apple is wrong in marketing them, and Will not do any business
>with them for so long as they do (among, as I said, many other reasons)

This is the reverse of capitalism, which I thought you were
talking about. Capitalism says "sell it, and let the consumer decide
what to buy." I don't fault IBM for selling the original PC, but I
am sorry that so many people have decided to buy into Windows and
the Win9x craze. I've seen Win95, and I still don't agree that it's
the right choice for many who will buy it. I don't fault Microsoft
for trying to gain market share.

>As for stereos -- For portability reasons, "boom-box" integrateds work.
>When I eventually decide that upgrading beyond that is in my plan, I certainly
>will not be looking at cheap poor-quality "integrated" stereos. I will buy

>each component separately and for the features that I want.

Portability. You've just answered the question below this paragraph.
And if you've looked at integrateds lately, many aren't cheap, and not
all of them are poor quality. When you buy your dream stereo,
you'll probably buy a receiver as a base unit. This is a combination
amp/preamp/tuner. This is decidedly all-in-one in comparison to old
hi-fi's and most audiophile systems. However, it's convenient.

>Name one, and I mean just ONE good, _INTELLIGENT_ reason why I should want
>to buy an integrated system.

Portability, Price, Asthetics, Ease of Purchase, Space...

Oops, I named 5. Sorry, just got carried away.

> Of course, they continued to switch them around, swap ESC and ~ on every
> model, only give you function keys on extended keyboards, etc.

Ha..! If that's supposed to be a slam at Apple, and a big compliment to
PC keyboards, you've never tried to find the "wandering tilde" key on very
many PCs... nor the Vertical Bar key, or the ESC key, or the Backslash key...

Even "official" IBM keyboards "continued to switch them around", and only gave
you function keys on the extended keyboards, etc.

Incidentally, when did "being different" become such a Sin..?

As I recall, that was one of the most zealously defended attributes of
Atari systems... (not that Atari has anything to do with this newsgroup).

So Apple decided to become more "compatible" with the PC using majority..
..so what..?

I guess that means Atari Corp "sold out" when they made their floppy disk
format DOS compatible..?

Oh.. I see.. that's different.

Ever consider finding some people who have bought those models and asking them if THEY feel "ripped off"..?

Seems to me you're espousing EXACTLY the same "they're too stupid to think for themselves, so they need to be protected for their own good" mentality that you accuse Apple of...

You don't actually think the people who exercised their FREE CHOICE and bought an integrated system actually LIKE them, do you..?

You don't think that maybe they LIKE the fact that there are fewer wires and boxes and plugs to have to worry about..?

No... of course not.. they're too stupid to know what they REALLY like, so they need to be protected from the Evil Empire at Apple.

You don't like integrated systems, and you don't like Apple.. fine.. we get the idea.

But you're not everyone, and your needs aren't everyone's needs.

THAT'S what has been said here.

Well folks, I'm off to wander among the mountains for eight weeks, learn about mountainy-foresty stuff, hike a lot and (quite importantly) earn a full quarter's worth of units. So, until August 18th, I bid you all farewell. Try not to kill each other too much when I'm gone, I have to have some place to release my tension! :D

Command is a hell of a lot more intuitive than control. You send your
computer a command and you manipulate a control. Option is better than
alternate because option can be written unabreviated on a double size
key. Which is more intuitive alt or option?

No, most people aren't that kind of moron. (In my opinion) Most poeple will
be concerned with some fairly basic features. What kind of gas mileage
does it get? What options does it have..? Will it fit in my garage..?
How much does it cost..?

They DO NOT give a damn what hardness the rear axle ball bearings are
tempered to, they DO NOT give a damn what kind of fuel injection the
engine has, they DO NOT give a damn how many degrees of advance the ignition
is set to at idle...

On the other hand, you are trying to force people to learn about Dot Pitch,
Horizontal Scan Frequencies, Vertical Refresh Rates, etc...

Stuff they likely DO NOT give a damn about.

All they need to know about the monitor in an integrated system is Will it
do what I need..? Can I do the company multimedia presentations on it?
Does it display enough colors to do artwork? Can I write a report with it?

If yes, then why do they HAVE to become a computer geek just to satisfy your
picture of "what's the right thing"...?

Why not insist the auto dealer educate them about degrees of ignition advance
too..?

Incidentally...

> Sigh. Has everyone on this group lost their ability to think?
> I'm not "crusading"

crusade (kroo-sad') n. 3. Any vigorous concerted movement or cause, especially
a reform movement.

>
>Still a ripp off! Why would anyone invest close to $3000 for an 030?
>
>As for memory, say ram doubler!!

Do you even _know_ what RAM doubler does? AFAIR it improves the crappy
Apple memory management a bit.

[To those who don't know: _every single program_ is given the same amount
of RAM, e.g. if you have only a 1 meg picture in Photoshop, it uses the
20 megs you have given it, and of course, if you start XPress and
Photoshop and run out of memory, terminating all programs will not
suffice to open a simple window (not enough RAM, still), only a system
reset will help]

Similar to the Copy-Doubler, with this add-on the Mac's file system
reaches the speed of *gasp* Ataris built-in file handling routines.

wemagor@fmsa.cca.rockwell.com (Wayne Magor) writes:

>It wasn't NG that said that, it was Sam Tramiel (CEO of Atari). That guy
>was saying things like "Jaguar is only a teensy weeny bit slower than
>the PS-X".

Reading the messages of anguish of PSX owners who experienced slowdown
playing Parodius and even more TORTUOUS SLOWDOWN with Raiden shows that
the PSX has a design flaw or defect in its 2D/sprite hardware. The
excuse that it is due to poor programming is a pretty lame when
you consider that Sony claims to have spent $500 (FIVE HUNDRED) million
on PSX development.

Raiden for the Jag ends up being a better two player game than the PSX
even though the Jag RISC chips are newer and thus have fewer and immature
development tools than the R3000 CPU.

However if other games in common like Rayman end up running as well or
better on something like a $99 Jag (Ubisoft claims it runs 65,000 color
multilayer parallax at 60 frames per second) as it does on the PSX, then
Sony could have a PR problem on their hands. It would show that the Jag's
64-bit Object Processor and 64-bit Blitter compare favorably to the newer
PSX design which Sony claims to have spent $500 (FIVE HUNDRED) million
developing.

>This guy thinks the Jag is as fast as the 3DO...

Everyone has seen the earlier games on the Jag like Raiden and Tempest 2000
that the 3DO is too weak to handle. The 64-bit 2D hardware in the Jag has
been shown to be superior in many ways to the newer PSX (that Sony spent $500
MILLION developing) so it's not surprising that the 3DO can't keep up with it.

Not only is the Jag generally FASTER than the 3DO it has potential to be a
lot SMARTER than the cacheless/clueless ARM60 CPU of the 3DO. Jaguar programmers for games like Alien vs Predator (AvP) remarked that it would be running
30+ frames per second if they used the weak AI/strategy, sloppy scrolling,
and warped perspective found in many 3DO games.

Let's face it, the Jag has 3 CPUs (two with internal SRAM to keep off the bus)
to handle AI tasks so as the programmers get more attuned to its multi-CPU
architecture we can expect an even greater sensation than that of HORDES of
Aliens hunting you down in Jag's AvP. On the other hand, for the 3DO
you can expect more of the shallow, insipid, boring enemies found in
Demolition Man, Jurassic Park, Slayer, ad nauseum...

Of course when you factor in the Jag's networking capability that will be showcased by games like BattleSphere and Hover Hunters, you simply must conclude that the 3DO and 32X will be left behind in what is perhaps the most important aspect of next generation gaming.

>... and can't understand why they've only sold 150,000 (according to him)
>whereas 3DO is closing in on a million units sold even though the 3DO is
>$400 and the Jaguar is $150.

Only a fool would spout sales figures without more substantiation. For example Sega claimed a great sellout of the 32X yet a number of companies have stopped development for it. Additionally Sega has FIRED, LAID OFF and/or LOST a number of executives and programmers which should lead most observers to conclude their sales number are more fantasy than fact.

You could substitute 3DO for Sega in the preceding paragraph and reach the same conclusion. Everyone still remembers Trip's "gift" to a number of 3DO employees: "Scrooge" Hawkins gave them pink slips the week of Christmas.

Unlike Sega though, 3D0 is pretty close to BANKRUPTCY and it was made even more evident when Dave Morse, who has very close ties with 3DO/NTG, recently resigned as head of Crystal Dynamics.

So 3DO is "closing on a million" much like the Titanic was closing on a iceberg. If Panasonic, Goldstar, Creative Labs and others actually like to lose enormous sums of money while making a beeline for a disaster then Sony, Atari and Sega are going to give them the "thumb's up" all the way to the bottom.

(Actually revise the preceding paragraph to omit Creative Labs since they bailed out of Trip's Titantic Adventure trip. Their 3DO Blaster card must have set a record for the quickest entry and exit of a consumer product ever.)

Meanwhile, following the $90 million patent settlement late last year with Sega, Atari has been taking methodical steps to gain significant videogaming market share. First the $99 Jag 1 console will likely take the top spot in Europe which has the second largest gaming market after the US. In fact as people have been pointing out in the UK, a Jag console *with* Cybermorph is selling for the very attractive price of L99.

Secondly, Atari has been using the proceeds of the Sega settlement to acquire both software titles/licenses and key programmers and managers. In fact while Sega was FIRING and LOSING programmers and managers Atari was HIRING the best of them. So key Sega, Electronic Arts and Williams titles are being ported to the Jag and ex-Sega programmers like Francois Bertrand are working on them. In fact, it has been noted that Atari has set up a new "Atari Magic" entertainment software division with Francois as its head.

Thirdly, the Jag 2 superconsole is a reality and is a very important factor in the market. Remember it was the Tramiels who founded and led Commodore to achieve a 30% share of the affordable 8-bit home computer market in the early 80s. They accomplished this with two systems: the VIC-20 and the

C-64. When the VIC-20 reached a price of $99 the competition like Timex, Sinclair, Mattel and Texas Instruments tried to react in kind and quickly found themselves bleeding in hundreds of millions in losses.

After Jack Tramiel gave the go ahead for the development of the C-64 in 1981, CBM/MOS Technology engineers created a new system that evolved from the hardware and software/OS of the VIC-20. As history shows, the C-64 was the devastating weapon that SLAMMED INTO the competition weakened by the VIC-20 price war. Commodore blew away Timex, blew away Mattel, blew away Texas Instruments, blew away Sony/Microsoft MSX, and of course blew away Atari Inc. By 1984, Commodore had grown from being merely another entrant in the home computer market to a billion dollar multinational company that made computing affordable to millions of people.

It is not surprising that the Tramiels spurred the rapid price reduction of the Jag 1 because the market is coming upon a similar situation as that of a decade ago. There will be a price war that eliminates companies like SNK, Panasonic, Goldstar, NEC and Fujitsu and it will weaken Sony, Sega and Nintendo. Then like the C-64, the Tramiels at Atari will launch the "supersonic" Jag 2 console within the next 6-12 months to take a pre-eminent position in the gaming market.

(Of course if Atari had $500 MILLION to spend like Sony their progress would be much quicker and have greater impact. From what has been related, the $90 million settlement from Sega and Alpex's $250 MILLION judgement upheld against Nintendo will clear the way for Atari to win HUNDREDS OF MILLIONS in compensation from NEC, Fujitsu, SNK, Sony, etc. so their impact will be felt on the industry both in the market and in the courts.)

>Wake up man! No one wants that piece of crap.

That's perfect. Just superimpose those words over a picture of Trip Hawkins and publish it in a business text of "Famous Last Words..."

: >... and can't understand why they've only sold 150,000 (according to him)
: >whereas 3DO is closing in on a million units sold even though the 3DO is
: >$400 and the Jaguar is $150.

Both of these figures are falsities. Sam Tramiel said that
150,000 figure was US only, and it's several months old - probably since
before the Jaguar price cut. Several sources have suggested that the
Jaguar's real installed base is around 250,000 to 300,000. Most 3DO sales
have been in Japan. In North America, the two machines are pretty close
in sales, though sales of both are pathetic. Don't flame me - I like both
machines. But rabid advocacy can be damn annoying.

: Only a fool would spout sales figures without more substantiation. For
: example Sega claimed a great sellout of the 32X yet a number of companies
: have stopped development for it. Additionally Sega has FIRED, LAID OFF
: and/or LOST a number of executives and programmers which should lead
: most observers to conclude their sales number are more fantasy than fact.

Exactly. The 32X was supposed to have sold 600,000 machines last
Christmas. That number has since dipped to 200,000. Many stores around
here are clearing it out because the Saturn is here. Eight months old,
and the 32X is getting cleared out! Poor choice of timing by Sega.

: Wait, 65,000 colors? Stop the presses! My 3DO only does 16.7 million!

That's 65,000 colors on screen. The Jag also does 16.8 million.
So does the 32X. So does the PSX and Saturn - your 3DO isn't anything
special in this respect.

: Where can I pick up one of these things? And where can I pick up a copy of
: Rayman? What, no one carries it because it's not out yet? Why didn't you
: include the proposed specs for the game for any other system?

The beta version of Rayman has been played by many people. The
original poster might have been lucky.

: Hey, are all of those CPUs 64-bit? That means you have a 192-bit machine
: in the comfort of your own home! That's pretty good math! Since Nintendo
: only had one CPU, and the 3DO only has one CPU, the 3DO is just as
: weak/powerful... Wow...

Wow ... the number of incorrect statements in the above paragraph
is pretty amazing. The 3DO has four seperate processors handling the
work. The SNES had two.

: You are so right. This does NOT mean that over five times as many people
: like 3DOs better than Jags... They were just out of Jags after such
: tremendous sales at the computer/video game stores and some little kids
: couldn't wait any longer for a gaming system. BTW, how many Jags have been
: sold and returned out of dissatisfaction (include Jag games in that list)?
: How 'bout 3DOs... What, not as many 3DOs? I wonder why...

Proof? Those "1 million 3DO's sold" and "only 150,000 Jaguars
sold" are so riddled with inconsistencies, I wouldn't believe either of them.

: I bet Saturn is doing horribly as well. I mean, seeing as they've sold
: over twice as many systems as Atari, and they haven't even been out for
: that long Yep, Sega has been a weak company from the beginning The

: Genesis must've sold what, five systems? :)

I hope you mean Japanese sales? Sega expects to sell all of
30,000 machines in the US by September.

: Now this makes me really excited! Was "Fight For Life" (A.K.A. "King of
: fighting games all over the world") a product of this wonderful bonding
: experience. I'm REALLY looking forward to all the other GREAT games
: they'll be coming out with. How 'bout Pong 2000?!?!

It'll go beside 3DO "Soccer Kid" and "Way Of The Warrior" :-)

: Wow, the Jag 2, with games TWICE as good as Club Drive, that SUPERB racing
: tile I've been hearing about lately... Since all the game magazines gave
: it ratings of about %50, that means that Club Drive 2 should get a %100!
: It'll be the best game ever! Almost as good as Need For Speed even!

Of course. Imagine what they could do with Super Burnout on the
Jaguar II? Wow ....

: Of course, Atari does have a GREAT history... I remember hearing about the
: Video Games system market hitting rock bottom after some video game
: company made several Marketing and Corporate errors... Oh, I can't
: remember who that was... And then they made a comeback with the Atari ST,
: which scared the shit out of all those big wigs over at IBM and Macintosh,

In Europe, the ST was a smash hit for several years.
Ethnocentricism is most unbecoming.

: Get REAL --- Get 3DO! Or get a Saturn! Or get a Playstation! Get ALL OF THEM!

Sorry, not many people have that much cash. 3DO's are still two
and a half times as expensive as a Jaguar in Canada.

: The only reason don't like the Jag is the software library. I hold no
: bias agains t Atari, as a corporation, though it may sound as if I flamed
: them earlier.

Actually, I found your sarcastic tone to be extremely amusing. If
you want to bash a system, you might as well have a sense of humour in
doing it. Cheers,

>> Mark <<

So the guy who is the PRESIDENT of ATARI says that his own product is a
little slower than Playstation, then you go so far as to say that the Jag
is faster. You also site the two games which I have ever heard have had
slowdown (out of the current library of games, which are supposed to be
great --- I will not actually vouch for them as I don't have a PSX), and
were very early games for this system.

> Raiden for the Jag ends up being a better two player game than the PSX

I agree completely! The thing that comes up when you put in an audio CD
has a pretty warped perspective! And the AI/strategy that comes with
listening to New Order and Pet Shop Boys? I can't believe they even put
out that system! So, howz your Jag work when you put in a CD? What? It
doesn't have a CD drive YET? Sorry?
(BTW: Gaming systems didn't actually have a measurable IQ last I checked?)

> Let's face it, the Jag has 3 CPUs (two with internal SRAM to keep off the bus)

Hey, are all of those CPUs 64-bit? That means you have a 192-bit machine
in the comfort of your own home! That's pretty good math! Since Nintendo
only had one CPU, and the 3DO only has one CPU, the 3DO is just as
weak/powerful... Wow...
And I really agree that all of these games for 3DO are absolute trash. I
really hate all the music for games like FIFA soccer and Road Rash, not to
mention Return Fire among others... The digitized, CD-quality sound
effects are horrible, too? And Jaguar has so many arcade translations
(Raiden) that are so much better than on 3DO (Samurai Showdown, Super
Street Fighter 2 Turbo) and PC ports (Star Control 2) and 3DO only has ONE
platformer (Gex)! Jaguar, they have?
Raiden! And Need For Speed? A waste of money!

> Of course when you factor in the Jag's networking capability that will be
> showcased by games like BattleSphere and Hover Hunters, you simply must

For that occasion when you and a friend both have a Jaguar in the same
room as well as another TV. I know that I wish I could network my 3DO when
I had it in the same room with another 3DO and another TV, since that
situation happens to me all the time? <sigh>

> to the bottom.

Yeah, and I bet that Sega has no faith in 3DO since it was very recently announced that Sega is going to be liscensing the M2 hardware designed by 3DO for their up and coming arcade games. I also bet that both companies will be made weaker by this deal since it REALLY makes NO sense whatsoever and can't benefit ANYONE, especially since 3DO's goal IS to create a universal gaming standard. Having a gaming superpower/megacorp use their technology won't help that goal...

```
Of course, Atari does have a GREAT history... I remember hearing about the
Video Games system market hitting rock bottom after some video game
company made several Marketing and Corporate errors... Oh, I can't
remember who that was... And then they made a comeback with the Atari ST,
which scared the shit out of all those big wigs over at IBM and Macintosh,
not to mention Nintendo and Sega... Oh, and the Lynx lasted so long... as
a paperweight...
```

```
>
> >Wake up man! No one wants that piece of crap.
>
> That's perfect. Just superimpose those words over a picture of Trip Hawkins
> and publish it in a business text of "Famous Last Words..."
>
```

When did Trip say that? (which IS what you just implied)... With weak
companies like Panasonic (some small Mom and Pop Japanese company, I think
they make some technological stuff, but I can NEVER remember with those
small, insignificant corporations), Goldstar, Sanyo, and now SEGA, 3DO is
going down hill on a one way track. Once the Jag's clearly superior
hardware and software (I am so excited about Highlander, which looks like
one of my favorite games, Alone in The Dark Yeah, the first one that came
out several years ago, the same...) combination hits Sega and Sony, who
have no money or hold in the market, as well as no consumer base, Atari
WILL reign supreme!

> ---
> To find out more about the anon service

Wait, why are you anonymous? 'Cuz no one wants to hear your crap about a system from someone who thinks that sales figures have nothing to do with the performance and popularity of a system? No one wants to hear about a system from a company that has had to lower the price to $169 (the latest I've seen) in order to sell one more system? 'Cuz you're afraid someone will come and burst the dream bubble you're living in?

Get REAL --- Get 3DO! Or get a Saturn! Or get a Playstation! Get ALL OF THEM! I WON'T go so low as to say get a life... I will say that your ideas seem to have little to no backing and your prestentation of the facts is an obscured, twisted view of reality, but I will not sink so low as to insult a person I don't know.

I would like to say at this point that any continuation of this thread probably does belong only in the .advocacy newsgroups, and that I should have been responsible and continued it there with this message... I apologize for the waste of bandwidth in the rest of the groups.

I would also like to say that my particular bias for 3DO and Saturn does stem from the fact that I own a 3DO and I have played around on the Saturn, which is a wonderful system. I encourage the competition of these systems, as well as the Playstation (I hear that this is great as well). I encourage the use of the Jag, which may sound contradictory to my previous statements in this message. I would have to say that I love my 3DO, and I can't wait to purchase:
1) The M2 upgrade due out this fall
2) The Saturn, which is available now in my area
3) The Playstation, which is supposed to be VERY competitively priced
4) The Ultra 64, which should have the best hardware around and some great developers (though i wish some of their stuff was more for mature audiences)

The only reason don't like the Jag is the software library. I hold no bias agains t Atari, as a corporation, though it may sound as if I flamed them earlier. I apologize for creating any misconceptions about how I feel toward the system and the company. I hope that Atari has more luck with their upcoming hardware, and I encourage dvelopers to make sure they use the full potential of the system.

I would also like to apologize to the person who wrote the message that I am quoting if it sounds like I flamed them. I have no such intentions, but I do find that his/her arguments are not strong, are based on weak and small amounts of proof, and that he cited very little in terms of the other systems. If you are going to make an effective argument, make it objective, or only subjective to the least. Use clear facts, and equally cover all aspects which are being presented on any subject material.

Thanks for giving me a chance to vent.
Kai Curtis

Is it just me, or has the aforementioned banter got ABSOLUTELY NO
RELEVANCE TO AMIGAS!!!??? Perhaps the author thinks were bothered that
ooooo! the Jaguar is better than the 3DO
ooooo! the Jaguar has 3 processors (phwoar!)
ooooo! Sony spent "$500 (Five Hundred) million" on the 3DO
^^^^^^^^^^^^

Yes, we can all read numbers..we are *clever* and
own Amigas. Silly man.

Why should we even worry about how stupendous consoles are
getting? Consoles and Computers (I am of the belief that they are two
entirely separate entities...) live in separate, almost non-conflicting
niches in the market. Families often own one (or more!) of each. We don`t
really want all this console propaganda shoved down our discerning
throats, thankyouverymuch.

Big Bro`

Excuse me..ClariSworks and WriteNow would be considered high end on the ST plaform. ClarisWorks takes up miniscule of system resources for the high capabilities that it offers. The software you listed of above as I aware are junk.. You are ignorant about the Mac platform..pwon You can run Writenow confortably on the Mac Classic. Older versions of PaGeMaker and Quark can run as well too. I under stand that the latest version of Calamus is on par with the earlier versions of PageMaker and Quark..Sad truth..

: Calamus has not been ported over to the other platforms with the exception of
: Windows NT. Serious publishers are using pentium class and PowerMacs espicialy
: with the new POWERMAC SCREAMER 9500.

Oh, the first argument of Peter. Calamus is bad because it is only ported for
one system. Hmm, did this mean, every program, which isn't ported to much
systems isn't good ? What is with the Mac OS and most of the Mac programs.
(Peter, I don't say they are bad, because I haven't worked with them long
enough to say so, but if I follow your argument....).
Besides that, Calamus works on every Mac.

>reset will help]

I this is the case then there is some hardware/software flaw in your system.

Oh, really. What makes you think everyone paid four times as much? Macs did not cost as four t times as much. One would argue that you pay for what you get.. Apple charged more because of R&D, marketing and support which severly lacked on the Atari ST line. I am not going to argue in the validy of Apple's pricing strategies but the market disagreed with your asertion that the Macs were overpriced., However, many Mac users paid $900 for the Macs when it first came out. Did Atari offer discounts to students/staff/faculty?

As for me, I had a IIC and an Amiga...

Hi!

Well I have no idea about how many 3do have been sold but in the interview with Sam Tramiel in the July issue, the following is said:

NextGen: How many Jaguars have been sold to date?

Sam: Approximately 150,000 machines in the US. We wish we'd sold more Jaguars in 94; ...

So I'm pretty much ready to believe the 150,000 around the late May timeframe. There may have been some overseas sales of course, but I would expect that 150,000 is pretty close to the installed base.

Anyway,
-Chris

Then I'm pretty sure you can at least add another ~50,000 for the
Jaguars sold in Europe and other countries if he said 150,000 was
for US sales.

[Article crossposted from comp.sys.atari.st]
[Author was grubby]
[Posted on 24 Jun 1995 11:46:25 -0400]

Can someone please e-mail me some FTP PIRATE WAREZ SITES
for the Atari ST? I know they are out there.

Yes, I realize someone will say this is what hurt the ST in the first place,
but now, at this point, I don't think it really matters.

If I could find a source for stuff for it again, I wouldn't think about
chucking it and getting an IBM. I love the Atari so much more, but face
it, what new games and stuff there are don't show up on shelves anywhere
in the U.S. for it.

I have a lot of great and rare stuff to trade for other, I won't be a
leech. Thanks very much.

: Oh, really. What makes you think everyone paid four times as much? Macs did
: not cost as four t times as much.

I don't know about where you live, but in Canada, Apple ripped
it's customers off royally. Amiga and Atari ST advocates used to pick on
Mac fanatics all the time at my high school. Especially when a color
520ST with a MIDI port, higher resolution, faster disk access, a point
and click interface and color graphics sold for $500.00 wheras a black
and white Mac 512 went for $2000.00.

: came out. Did Atari offer discounts to students/staff/faculty?

I don't know about Atari USA, but Atari Canada did do some things
in that area. I remember reading that they donated several labs of
computers to universities around here and setup a discount program. They
also offered an upgrade program where people could turn in their old
8-bits for a 520ST.

: As for me, I had a IIC and an Amiga...

And yet you bash the Amiga regularily???

3do is approaching 300 titles now. No one is disputing this figure..
3do is widely available, the Jagflop is not. Its distribution, marketing and
titles that well make/break a console. The Jagflop fails three of the
criteria. There is nothing that Atari can do about it..

>
> Roberts point was, if Atari have acknowledged the problem, they won't be able

>

Again, the public doesn't give a crap about the Jagflop. Price is an issue,
but it has not benefit the Jagflop, GET OVER IT! Again, it doesn't matter if
Atari lowers the price to $%99 becaus e the public will not know tdB due to

lack of distribution, marketing and titles, GET OVER IT! As for me being cluless, its the other way around. Can't you get it, the public does not care about the JAGFLOP, GET OVER IT...

>

You are pretty sad if you still believe that Atari has a chance.. Atari is not viable, GET OVER IT! What makes you think that Tempest sold that many copies? Evidence please? Atari did not even do $5 million in their last quarter....The only people buying the Jagflop is the converted who buy's anything Atari..eu

> If people did not think the Jag and Atari were viable, then they would

"Memory compression"? Are you _sure_ that the files/programs are
compressed with - say - an LZSS algorithm? I am pretty sure they are not,
as most of the Mac's RAM is wasted on the 'normal' memory management, i.e.
is unused anyway. In what way are programs "compressed" in RAM? And how
does a compressed program _run_ (that's what they have been loaded for)?

Yes, of course. The hardware flaw is called Macintosh. The software flaw
is called MacOS.

Yes, of course, I mentioned them both before. This time the software flaw,
MacOS, is responsible.

: 3do is approaching 300 titles now. No one is disputing this figure..

I am. Didn't you read Marty Chin's list of honest to goodness 3DO
video games available. There were just over 70.

: 3do is widely available, the Jagflop is not.

Says who? In Ontario, the Jaguar and 3DO are both restricted to
video game stores for the most part. "The Bay" and "Radio Shack" were
carrying the 3DO, but have cleared it out due to poor sales.

Its distribution, marketing and
: titles that well make/break a console. The Jagflop fails three of the
: criteria. There is nothing that Atari can do about it..

And the 3DO is better in these areas? I have to look almost as
hard to find a 3DO as I do to find a Jaguar. Marketing? I've seen a lot
more Atari ads than 3DO ads on TV and in Magazines. The 3DO has some
killer titles, but the pace of good games has really fallen off lately.

: Again, the public doesn't give a crap about the Jagflop.

Ah yes ... Peter shows his mind reading abilities again.

: about the JAGFLOP, GET OVER IT...

But why should we Peter? If we didn't care about the Jaguar, what
fun would you have????

: When are you going to take off the Atari hat, that Atari's window is no more,
: GET OVER IT....

You just missed every point he said and flamed back with your
typical brainless, factless response. You really are a sad excuse for a
debator Peter. And to think you want to make a career of teaching people
have to find information. That is quite amusing.

: There is no room for the Jagflop.. Atari is not considered viable in the
: market, ACCEPT IT!! Atari will not have sold enough to maintaine their
: miniscule developer base, they have to eat!! Atari may be around in its former
: shell..

If that were the case, every Atari developer would have jumped
ship by now. They haven't. UBI Soft is still bringing out Rayman. TWI is
still bringing out Power Drive Ralley and Primal Rage. Many other
companies are still bringing out there Jaguar wares. Permit me a small
... GET OVER IT!!!

: What would Atari have left to sell? Atari is out of the PC market

Are they? They're going back into the PC business via CD-ROM games.

, the
: lynxflop bombed.. Atari is deluded, I mean the Tramiel retrads..

The "Lynxflop" sold more than 1 million consoles. That's more
than the 3DO, CD-i, Turbografx-16, Turboexpress, TurboDUO, Neo Geo, Neo
Geo CD, Sega 32X, and CD32. Not as bad as you suggest.

: Can't accept the truth that I am right.. I was right about the Christmas
: performance which was dismal as well as the status of the Jagflopcdrom..Well I
: guess I am batting a 1000..

No ... you said Atari was supposed to be bankrupt last Christmas.
You said that Atari's Jag would never have more than 20 games.

Bye Petey!

Reading an interview in the UK magazine 'Edge' Sam Tramiel (I think it was Sam, might have been one of the others) says in response to a question that 150 000 jags have been sold in the US (that was until the date of the ECTS)

You have to say thats an incredibly low figure for the machine that Atari have been everything on. Any comments?

> You have to say thats an incredibly low figure for the machine that Atari
>have been everything on. Any comments?

A couple.

Firstly that's a US figure. And in last months EDGE (Released May 25th), interview probably conducted late April/early May. Can't remember exactly when the $149 price came into effect but I know it's recent. I think the sales since then would be better than average.

I think there's ~100,000 users in Japan and Europe, not to mention Canada and Australia. I'd expect easily 250,000 worldwide, and maybe 300,000+, who knows.

Secondly - Atari are still around! They're here, they're real. They and other companies are still producing both hardware and software for the machine. It's possible that the core unit will drop down to $99 and even if it doesn't, during the run up to Xmas it looks like it will be at least 1/2 the cost of any other next generation machine. ($150 vs the $300 of the 3DO or PS)

There are a lot of people trying to write the Jaguar off already but I don't see Tramiel that worried. I think after the next 6 months their user base will be well over 1/2 million, and whilst not huge it most definitely is viable.
That's the good thing about the video-game market it can support more than one console. Look how long Neo-Geo have lasted in their particular niche market for example. I think with a sub $150 console (Especially with Nintendo and Sega practically dumping their 16-bitters) Atari will have their own little niche market also, even if they don't get to compete with the big boys. I'm still not ruling that out either though. (But I'd give you 50-1 odds!) :-)

Scott.

The Jag II is about as real as the M2 now. Both 3DO and Atari claim to
have finalized the chipsets on these things, but neither has actually shown
a working prototype to anyone. 3DO has shown "realtime emulated environment"
demos at E3 and in NYC, while Atari claims it will have Jag II development
systems in the hands of developers in September...

I'm a jag developer, and I haven't seen a Jag II yet. Any 3DO guys see
an M@ yet (R.E.E. (tm) does not count)...

I suspect we will ultimately see the Jag II. The trouble is that if Atari
abandons the jaguar I, no one will respect them enough to even attempt to develop
for it and its sales will make the jaguar's look elephantine...

Time will tell...

Scott

That's false. The M2 has reportedly been shown to several developers; the
working prototype.

I wouldn't be so quick to put the JagII and the M2 on the same level. At
least we have seen announcements, prototype casings and controllers, full
spec information, and demos of the M2.

If you remember the M1, the demo tapes were just as good, if not worse, than
what it really turned out to be.

Thanks,
chris

I don't visit this newsgroup too often,.....
A question: Has there been any discussion here concerning the JAG II ???
I live in San Jose, Ca. and in the SJ Mercury News, Atari has
(for the last couple of months) been placing ads for hiring
programmers/whoever for their Jag II machine. Does anyone have any
further info on this system???

Thanks, Ron

The programs in RAM are compressed (I sounds like you think I mean programs
one disk) using an algorithm that I'm sure they're not willing to share :)
The way it's suppost to work is that instead of putting background programs
into virtual memory they are compressed into RAM and expanded when needed.
If necessary, RAM doubler will put program RAM into a file but usually
compressing it works fine. The problem with this technique is it doesn't
help with one big program.

>Yes, of course. The hardware flaw is called Macintosh. The software flaw
>is called MacOS.

How witty of you. I realised when I said this that I might get this reply.
It seams that I was not disappointed. Still, the operating system needs
free contiguous memory to run additional applications. So even if you
have 2 megs free you might not be able to run a 512K program if that 2 megs
is scattered all over memory. The mac can try and more the data to other
locations but only some types of data are moveable (ie handlers).
Unfortunately, the only thing you can do now is either buy ram doubler
or plan the order that you want to open you applications. Brian's rule:
last quit, first open.

Wait a sec. How long did you give the computer before you rebooted? The new
Macs do their best to recover data when they encounter a "damaged" disk.
That means that a dialog may not appear for 2+ minutes.

<Regarding the University of Maine>
The campus store heavily pushes the Mac and the school ran a
program where people could rent LCs with the option of buying
them. This was last year. How good is an LC today at running
modern Mac applications?
Despite the campus store, clones are the choice of most students.
Of course, I have met ST users there too.
And, no, rooms don't come with Macs. I would attend a different
university if this were so. I will put my Falcon up against
the LC anyday.

Dave,
Yes, the old LC. Running at 8Mhz, I believe? The program has
been stopped but it was continued through last year with
underpowered, pathetic original LCs. I believe that the school
got quite few cheaply.
The store, of course, only sells more recent systems. And, the
school no longer leases Macs thank goodness.
Many people choose to run pirated copies of Word and Doom instead.

Which LC? The original LC, which hasn't been in production for many years?
The LC II or LC III which also haven't been in production for years?
I seriously doubt it was those machines your school was renting out last year.
The LC 475, which is about two years old, was just discontinued a few months
ago, but still runs modern applications decently? Or the LC 575, 580, and
630, which are even more recent and are faster than the LC 475? The 475,
575, 580 and 630 all can run modern Mac applications at a good speed.

The M2 is due out around Xmas but will probably be set back until early '96. I think 3DO generally try and stick to their estimates as well.

Jag II is rumoured to be set for a Xmas '96 or even mid '97 release, and even by Tramiels own statements it does not look like it will be a significant step up on M2. I think the Jag II will be scrapped much as the 32-Bit panther was in favour of the Jaguar.

The M2 is on par with Nintendo's U64 in my books. Both said to be similar(ish) capabilities, and both release about the same time. The Jag II really is vapourware it it's extreme at the moment I feel.

Seen a Jag II yet? Seen an M2? Same answer? Yup...

I'm not a 3DO basher so much as a market skeptic. I take shots at >ANYONE< that I believe is pulling a fast one...

Sadly, most of Atari's problems can mostly be attributed to low budgets and incompetence rather than any desire to take the consumer for his hard-earned bucks. These guys really think they're making a killer title and then the lousy sales bring home the truth (for about 5 seconds)...

If there were more 3rd parties on the jaguar to make up for this, the jag would be in fine shape in much the same way that EA and Crystal Dynamics smooth over the junkware on the 3DO (and occasionally make some of it themselves to be fair)...

|> The M2 is due out around Xmas but will probably be set back until early
|> '96. I think 3DO generally try and stick to their estimates as well.

3DO misses dates too, just not as badly as Atari... There are a lot of 3Downers out there pissed about late software right now... Some even dumped their 3DOs...

Doubt it, if Atari survives, whatever they release will be called the Jag II... Atari always releases something... It may be 5 years too late and irrelevant, but they release it...

That's right, both of them live inside SGI Onyxes...

Well, one can debate that Acclaim was running real U-64 Hardware at E3 actually so it is the least vaporish of the 3...

The original LC used a 68020 running at 16MHz, if I'm not mistaken. You could run ClarisWorks, Quicken, WordPerfect and a bunch of other decent software, even with only 4Mb of memory. I would not pay more than $500 for an LC system, including keyboard and monitor.

i have atari works brand new
speedo gdos brand new
for sale

also multitos

WORKS+SPEEDO+MANUALS = 50.00 VER. 1.2

WORKS ALONE NO MANUAL =25.00 VER 1.2

WORK+SPEEDO NO MANUALS =35.00
MULTITOS NO MANUAL 25.00
MULTITOS WITH MANUAL 30.00
ALL VERSIONS OF ATARI WORK ARE 1.2
i aquired many brand new disks and some packages had no manuals so that
why...

guenther@cabal.shnet.org (Thorsten Guenther) writes:

>a) the Mac multitasks (cooperatively only, but it does), compressed
>programs don't run, hence they don't multitask

This is what allows the program to work. Since all programs work
by explicitly releasing control to the operating system it's possible
to path the trap (GetNextEvent) and uncompress that program before
control is given to it. Of course, if two programs are constantly
switching control then you'll get a fairly large speed hit.

>b) most of the Macs memory is wasted, not used (20 megs for Photoshop, 20
>for Quark, e.g.), therefore an improved memory management would help much
>more than some obscure "compression" method, a method that has never been
>considered to be ported e.g. to the market of Intel PCs.

That's exactly what I said. RAM doubler doesn't help very much if you're
using one big program. Connectrix does say that they will make a
Copland version though. I can't see this working in anything but
the 'compatibility box' since the rest of the system will run using
protected memory. I bet that ram doubler doesn't exist for the PC
because Windows has a better memory management scheme and faster
virtual memory.

Yes but not same background. Seen anything other than Tramiel saying
"Oh, and by the way we're gonna do a Jag II as well.."?
i certainly haven't, whereas 3DO have held conferences for the M2
and clearly have a plan for it's implementation and release. I don't
see any of that from Atari.

> I'm not a 3DO basher so much as a market skeptic. I take shots at >ANYONE<
> that I believe is pulling a fast one...

So would I - I just don't believe 3DO are. If I were forced to put
my trust in someone in the video game market, it would have to be
3DO - Atari, Sega, Nintendo just don't figure in that respect.

> Sadly, most of Atari's problems can mostly be attributed to low budgets
> and incompetence rather than any desire to take the consumer for his
> hard-earned bucks. These guys really think they're making a killer title
> and then the lousy sales bring home the truth (for about 5 seconds)...

I agree completely - as I said I like Atari - but I'm not silly enough
to actually believe anything they say - they've been wrong far more times
than they've been right.

> |> The M2 is due out around Xmas but will probably be set back until early
> |> '96. I think 3DO generally try and stick to their estimates as well.
>
> 3DO misses dates too, just not as badly as Atari... There are a lot

> even dumped their 3DOs...

Fair comment - just I'm talking hardware here - I think Panasonic,
Goldstar, Matsushita et al would be pretty pissed if they thought 3DO
were taking them for a ride.

> |> The M2 is on par with Nintendo's U64 in my books. Both said to be
> |> similar(ish) capabilities, and both release about the same time. The Jag
> |> II really is vapourware it it's extreme at the moment I feel.
>
> That's right, both of them live inside SGI Onyxes...

No they don't - 3DO have shown the chips (Just not in a box working).
To award the 3 systems a 'reality-pecentage' I'd say
M2 is about 70% real.
U64 about 80% real (Although the price/spec ratio needs to be addressed)
Jag II about 10% real.

That's the impressions the various companies are giving to me.

> Well, one can debate that Acclaim was running real U-64 Hardware at E3
> actually so it is the least vaporish of the 3...

I think the U64 *is* the least Vapourish of the three.
Nintendo *will* produce something - they have to - they're not gonna
just give up on the whole gaming industry.
3DO look like they've planned the M2 for a while now - a lot of time
seems to have gone into it, and I've heard too many quotes from
respected industry leaders for it to be all bollocks.
The Jag II I have heard nothing from other than Tramiel saying that
he's going to do one. And there's NO WAY I'm putting my faith in
that! :-)

Scott.

3DO now has 300 titles does it?? Where did this other 100 spring from
all of a sudden?! I'm doubtful.
You're right about distribution and so on, but you seem to forget a
lot of other examples - how widely available was the Neo-Geo console?
Not at all, but yet this company is still going strong.

> Again, the public doesn't give a crap about the Jagflop. Price is an issue,
> but it has not benefit the Jagflop, GET OVER IT! Again, it doesn't matter if

> cluless, its the other way around. Can't you get it, the public does not care
> about the JAGFLOP, GET OVER IT...

Oh you are so tiresome!
The "public" doesn't give a stuff about any of the consoles - they care
about what they can buy their kiddywinks for Xmas for the least possible
outlay - this Xmas the Jag will be around dirt cheap, and it will
sell. Probably not a lot no - but it doesn't have to!!

> When are you going to take off the Atari hat, that Atari's window is no more,
> GET OVER IT....

yawn, yawn, yawn..
I don't wear an "Atari Hat" I personally think all 5 main companies
(Sega, Nintendo, Sony, 3DO, Atari) will be around for a good while
yet. You seem to be so convinced that Atari are already dead yet I don't
see this - I can still buy Atari gear, I can still buy Atari games,
games and hardware are still being produced - this is a FACT. And this
is not the signs of a 'dead' company.

> There is no room for the Jagflop.. Atari is not considered viable in the
> market, ACCEPT IT!! Atari will not have sold enough to maintaine their
> miniscule developer base, they have to eat!! Atari may be around in its former
> shell..

There is no room for Atari?? You can predict the future can you - oh
well done I'm impressed! Atari ARE STILL ALIVE!! They are still selling,
they ARE viable!!!

> You are pretty sad if you still believe that Atari has a chance.. Atari is not
> viable, GET OVER IT! What makes you think that Tempest sold that many copies?
> Evidence please? Atari did not even do $5 million in their last quarter....The
> only people buying the Jagflop is the converted who buy's anything Atari..eu

Evidence?? Just ask any Jaguar owner if they have it! Anyway, I've
yet to see you come up with any evidence, although I hear that spouting
unconfirmed bullshit os your speciality so I'm not expecting any.
I *know* how many units the Jag has sold (Over 200,000 worldwide) and
with more to come I dare say. How many do you need to be considered
viable? And then tell me how many Neo-Geo units were sold.

Also another fact - both 3DO and Jaguar have sold about the same
number of units over here in the UK - neither is ahead of the
other.

> What would Atari have left to sell? Atari is out of the PC market, the
> lynxflop bombed.. Atari is deluded, I mean the Tramiel retrads..

Atari have the Jaguar you fool! And by the way the Lynx sold over
a million units, well in excess of an awful lot of other games
producers who are also still in the market - the fact is you don't
have to first to be a contender in this business!
Atari is around, and will be around for some time to come.

Scott.

If I can't play it, it doesn't exist... I can't play any of these things
yet...

> That's the impressions the various companies are giving to me.

Well, you're just reasoning from reputations rather than the facts.

> > Well, one can debate that Acclaim was running real U-64 Hardware at E3
> > actually so it is the least vaporish of the 3...
>
> I think the U64 *is* the least Vapourish of the three.

Uh, they already lied once about this sucker. What's to stop them from doing
it again and again?

> Nintendo *will* produce something - they have to - they're not gonna
> just give up on the whole gaming industry.

No, but remember the SNES CD? If they decided (and I think it's unlikely
they will) that it's to their advantage to wait another year, they will,
and piss everyone off once again... They don't care, they don't have to...

> 3DO look like they've planned the M2 for a while now - a lot of time
> seems to have gone into it, and I've heard too many quotes from
> respected industry leaders for it to be all bollocks.

None of it is bollocks. All the companies do R&D. It's just a question
of what sees the light of day and when... $*%*%*ing Nintendo just
canned StarFox II. That pisses me off far more than the delays in

several jag games and the CD...

> The Jag II I have heard nothing from other than Tramiel saying that
> he's going to do one. And there's NO WAY I'm putting my faith in
> that! :-)

I'm a developer, and I've heard more than that, although you wouldn't need to be a developer to have heard most of what I know. Suffice to say, I believe the design exists, which until 3DO finds a producer, is all that one can really say about M2... Unless of course, someone has actually seen the unit in action at which point the M2 is for real... Someone please prove me wrong here rather than disagree with the rest of my post which is all moot...

Scott

Ob3DO: I'll bet you didn't know that when they unveiled the 3DO to developers for the first time, the prototype burst into flames. Things 3DO doesn't want you to know... Ah the magic of the NDA...

: : 3do is approaching 300 titles now. No one is disputing this figure..

: I am. Didn't you read Marty Chin's list of honest to goodness 3DO
: video games available. There were just over 70.

As opposed to maybe 25 or so for the Jaguar. And the 3DO titles tend
to be of better quality - Road Rash, Need for Speed, FIFA Soccer, SSFII,
WCIII etc. The best Jag titles are Tempest 2000 and Doom with an awful lot
of dross.

: If that were the case, every Atari developer would have jumped
: ship by now. They haven't. UBI Soft is still bringing out Rayman. TWI is
: still bringing out Power Drive Ralley and Primal Rage. Many other
: companies are still bringing out there Jaguar wares. Permit me a small
: ... GET OVER IT!!!

3DO has many more developers, the Saturn and PSX will have more still.

: : What would Atari have left to sell? Atari is out of the PC market

: Are they? They're going back into the PC business via CD-ROM games.

Are they making or selling computers any more? Atari are just a games
console company now - and not a terribly succesful one at that.

: , the
: : lynxflop bombed.. Atari is deluded, I mean the Tramiel retrads..

: The "Lynxflop" sold more than 1 million consoles. That's more
: than the 3DO, CD-i, Turbografx-16, Turboexpress, TurboDUO, Neo Geo, Neo
: Geo CD, Sega 32X, and CD32. Not as bad as you suggest.

Hmmm, but where are the games and I don't see too many in shops. I own
a lynx myself - a great piece of technology but a prime turkey for actually
playing games due to the lack of software.

::Can't accept the truth that I am right.. I was right about the Christmas
::performance which was dismal as well as the status of the Jagflopcdrom..Well I
::guess I am batting a 1000..

: No ... you said Atari was supposed to be bankrupt last Christmas.
:You said that Atari's Jag would never have more than 20 games.

Sinflop is definitely onto a winner Jag-bashing. He simply can't lose,
the Jag has failed to capture the gaming publics imagination. Hardware
sales are low, software quantity and quality is poor and a new range of

consoles are about to hit the shops that totally blow the Jaguar out of the water hardware and software wise.

Atari has made EXACTLY the same mistakes it made before. Poor promotion, too few games, low quality games, delayed hardware (CD Drive). Now its only hope is to make the jaguar as cheap as possible and sell to the extreme low end - given their past record I doubt they'll manage to shift the volumes they need to make a cheap base system feasible.......

: > 3do is widely available, the Jagflop is not. Its distribution, marketing and
: > titles that well make/break a console. The Jagflop fails three of the
: > criteria. There is nothing that Atari can do about it..

: 3DO now has 300 titles does it?? Where did this other 100 spring from

So the 3DO has 200 titles then, only about 175 more than the Jaguar...

: all of a sudden?! I'm doubtful.
: You're right about distribution and so on, but you seem to forget a
: lot of other examples - how widely available was the Neo-Geo console?
: Not at all, but yet this company is still going strong.

I wouldn't say going strong - they are very low profile and make a lot
of money out of their arcade business. The games although good are mostly
arcade beat em ups.

: The "public" doesn't give a stuff about any of the consoles - they care
: about what they can buy their kiddywinks for Xmas for the least possible
: outlay - this Xmas the Jag will be around dirt cheap, and it will
: sell. Probably not a lot no - but it doesn't have to!!

Oh but it does - if you want to see a decent amount of quality software
that is. No point in being cheap if it plays cruddy games.

: Evidence?? Just ask any Jaguar owner if they have it! Anyway, I've
: yet to see you come up with any evidence, although I hear that spouting
: unconfirmed bullshit os your speciality so I'm not expecting any.
: I *know* how many units the Jag has sold (Over 200,000 worldwide) and
: with more to come I dare say. How many do you need to be considered
: viable? And then tell me how many Neo-Geo units were sold.

Only 200 000 in a year and a half? A machine that Atari dumped their
computer line for and bet their shirt on? A machine that was supposed to
be the most powerful console in the world (it was for a year too) and is
really cheap?? Atari have screwed up BIGTIME with the Jaguar. They just
never learn do they?

:
: Also another fact - both 3DO and Jaguar have sold about the same
: number of units over here in the UK - neither is ahead of the
: other.

I can go into the local Virgin megastore and see whole rack full of dozens
of 3DO games. There are maybe six or seven Jaguar titles.

Gavan,
Please enlighten us with how you would've made the Jaguar into
a big success. Apparently you would've waved a magic wand and all
would be lovely. How many times will you tell us that Atari
is an incompetant company when just a little while ago you were
praising the wonderful Amiga? Seems silly to me. Commodore was
much more poorly run than Atari.
Your Jaguar bashing is almost as tiring as Sinclair's. Why not
try to play Cybermorph, Iron Soldier and AvP and then get back
to us? My friends were impressed by the Jag; much more than by the
3DO.
As far as Atari computers I can't wait to see what C-Lab offers
in the future. When is Escom shipping or producing Amigas? It
is heartening to know that the C= logo will be used on its line
of clones. Good tribute.

For someone who keeps encouraging everyone else to get over the Jaguar,
Peter has shown a remarkable inability to do the same. Every time I
accidently read this drivel I just conjure up the mental image of Peter
sitting at home by himself with nothing better to do than to complain
about a video game system. Peter, get some friends. Shave. Wake up
before 2 in the afternoon. Take a walk in the park. You'll thank me.

I have a Falcon too! I took it into my PC dominated workplace recently
and *everyone* was impressed. My manager wanted MultiTOS and a couple
of other packages. I explained that the Falcon wasn't a PC machine, but
I still dont think he understood.

I love the uncluttered nature of the machine. Windows is too top heavy
and cumbersome. GEM is simple and easy and doesn't get in the way.
Now that some programmers are using the 32 MHz DSP chip as a co-processor,
there are some stunning programs out that can do things a 66 MHz PC
would struggle to. It is now possible to link a TV input to a Falcon
and watch TV in a GEM indow whilst you do some word processing for
instance. It can also map this image onto the faces of a spinning cube in
REALTIME (like Quantel).

Although Atari dont make computers anymore, the Falcon hardware is
now licensed to C-Lab in Germany. They now make the machine in a
'music ready' package for hard disk recording. There is also talk of
a cut down basic entry machine to fill the gap between consoles and
expensive PC/Macs.

: >Have you ever used BOTH operating systems and in a position to even
: >comment?

: This kind of stuff really belongs in the advocacy/computer
: religion/flame groups, so I've adjusted the followups accordingly.
: But, yes, I've used both and I feel much more comfortable with the
: Atari. It crashes much less frequently than an equivalent PC running
: Windblows or an equivalent Mac.

Since the followup was directed at me, I shall answer...

First, I am a network engineer for our county government. I have
been Microsoft certified in Windows NT Server. We have 15
Windows NT Server networks running, 5 more in the next month,
and an untold number in the next year. Each network has between
10 to 100 PC's, generally 466DX2's, running Windows for Workgroups.

So to answer the question, yes, I think I have used Windows enough
to be able to judge.

Given my job duties, I qualify to have a government PC at my
house. Do I have one? No. I use my Atari. I had three PC systems
in the past 5 years, up to a P60 that I recently just got rid
of. Since I keep going back to my Falcon, what does this tell
you of my feeling towards Windows?

I could give you any number of specific stories of things that
happen in a Windows environment but shouldn't. How about crashing?
Sure, Windows may be the biggest installed user base when it comes
to computing, but who says that it is the best?

^^^^^^^^^

Don't you dare start this with me again ;).....there would be less than
500 Jags in this country (500 being the maximum, more like 200).

Please, Atari US, if you are listening, realease the Jag over here,
and you will kill all in your path. Not that the 3do, PSX and to a lesser
extent Saturn aren't great, but there is no way, and it has been proven,
that Australian's will en masse buy expensive video game products.

That's why those self obsessed bastards at Nintendo have got it right
with the NU64....sure it will lack all the sexy FMV and raytraced sequences,
but will sell due to the low price....that's why Atari (known as a video game
company over here) are stupid not to release and advertise over here
(much cheaper than in the US or Europe)

(And Yes, I would love to be involved in a new Atari Australia :)

Are there any other Jag loving Aussies out there who are willing to
help me, a humble uni student, import, advertise and sell Jags and become
.....how does Daffy Duck put it?...'comfortably well off!'

Sorry for ranting again, but this is a real waste....

Email me,
Skip....who _will_ one day become Pres. of the new Atari Australia :)

: As opposed to maybe 25 or so for the Jaguar. And the 3DO titles tend
: to be of better quality - Road Rash, Need for Speed, FIFA Soccer, SSFII,
: WCIII etc. The best Jag titles are Tempest 2000 and Doom with an awful lot
: of dross.

I never said the 3DO didn't have the title advantage. I was just
pointing out a massive flaw in Peter's argument. As for the 3DO games,
there are about a dozen winners and a *LOT* of duds. The titles you
mentioned (especially FIFA soccer) kick ass, but to say that "Soccer Kid"
is better than "Aliens Vs. Predator" is silly.

: 3DO has many more developers, the Saturn and PSX will have more still.

The 3DO doesn't have that many more developers *ACTIVELY*
developing than the Jag. As for the PSX and Saturn, the lists are big,
but I'll reserve judgement until I see the actual games on the shelves.
There are 200+ developers on the Jag list remember?

: Hmmm, but where are the games and I don't see too many in shops. I own
: a lynx myself - a great piece of technology but a prime turkey for actually
: playing games due to the lack of software.

The Lynx is also six years old. I found a lot of the games were
very good for that machine. Of course, I only have six.

: Atari has made EXACTLY the same mistakes it made before.

Some of the same mistakes. Corrections they made ... increased
advertising ($14.5 million spent on Jag adverts last year vs. $0.3
million on the 7800 over four years), getting 3rd party support, dealer
programs, going to local malls, sponsoring etc. There are many flaws, but
there have been many improvements too.

: too few games, low quality games,

The first I'll give you, the second I won't. Many Jaguar games
are pretty solid, though not system sellers. There are only a couple of
real turkeys.

: So the 3DO has 200 titles then, only about 175 more than the Jaguar...

No! The 3DO has maybe 200 titles, but only 71 or so are actually
games.

: I wouldn't say going strong - they are very low profile and make a lot
: of money out of their arcade business. The games although good are mostly
: arcade beat em ups.

You really know very little about Atari do you? Your info about
the arcades is only 10 years out of date.

Listen, there aren't even CLOSE to 129 edutainment/movie/instruction titles available for the 3DO. The games far outweigh these titles in number.

What skews the 3DO title count somewhat is that they are counting Japanese-only titles in there. To be fair though, they can be bought and played on your 3DO if you really want to.

Atari's Jagflop is dead. Just because there is stock left doesn't mean that it
will be around forever. Now that the 3do consoles are below $300 now, more
stores will clear out what ever excessive Jagflop inventory is sitting around..

>> There is no room for the Jagflop.. Atari is not considered viable in the

>

200,000 worldwide is not enough to brag for supremacy. What does Neo-Geo have
to do with this. I don't care about NeoGeo, What about Atari.

It does matter how many units are sold because developers decide if its worth
it.

> Also another fact - both 3DO and Jaguar have sold about the same

>

Wow, Atari sold one million Lynxflops in a five year period while the lame boy exceeded over 10 million units..

Being first in the industry is an understatement. Is this now the reasoning among the Atari fanatics that being first, second and third is not important? There is no room in the industry for fifth or last place. I can see the developers beeting dowm Atari's doors now..

When it comes to those who don't understand or have the reasoning to
understand why Atari has lasted so long. This is for you. I have been
using them from the begining 400 thru to the ST's. And as far as I am
concered they are still a good machine. I still use the old modified 800
with my family and enjoy using it. It has been a work horse and has not
broken down in all this time. I can't say that for some of the other
machines I hear horror stories about from time to time. But the same can
be said about the Compaq 486 I now use for both business and pleasure.
But when I am done with that, it is back to the old 800 to have fun.
And that is what its supposed to be all about is it not. All the flaming
in the posts to each other won't change that. Because it still falls back
to personel preferences when it comes to the different machines. Its like
a bunch of kids who keep saying to people that my dad will beat your dad
because they don't agree on something. And it is the same thing here with
these posts. Instead of pointing out the differences and contributing usefull
talk to help each other. You would rather flame each others machines
which in reality does not make any sense. And even before I post this, I
know some where there will be someone who is going to flame my respons to
this. This will only prove my point. Later.

Every time I read a Peter Sinflop message, I get a mental image of one of
those REALLY OVERWEIGHT people you hear about occassionally on the news. You
know, 600 pounds of blubber, hasn't left his bed in four years, sometimes
has a life-threatening medical condition and the doctors have to chainsaw his
door open to get him out...that kind of stuff.

I suspect THAT is why Mr. Sinflop hasn't done anything like getting a life,
and therefore graces us with his whiny presence instead. B-)

: Video game insiders. I believe as I recall came from BusinessWeek.

Give me an issue number. I'd like to look it up. Being the
astounding librarian you are, it shouldn't be hard to relocate that
issue. I'll be waiting.

: Were? I have not seen commercials except for the print ones dealing with the
: vapor JagflopCdrom..

I have seen four different Jaguar commercials. I've seen at least
a dozen different print ads. For the 3DO, I've seen one print ad and no
commercials.

: No, is an understatement..Very few are developing for the Jagflop and Ataris
: distribution sucks..Now that 3do consoles are below $300 with one and two pack
: ins, the pressure is on Atari to make something happen. I doubt it when Atari
: is not considered viable in the market.

Yes, the distribution sucks. As for the list of people
developing, ask look on the Jaguar web page for accurate info. As for the
3DO, I would wager that the price of the Jaguar will drop to $99 for
Christmas in order to counteract.

: Travy is being awfully quiet lately..I wonder why..

Working on articles for the new Jaguar magazine. If the Jag were
dead, why would someone be publishing a magazine? For that matter, why
would the current video game magazines still be running Jaguar info?

: 3do..

You really know little about the 3DO, do you? Heresay again.
According to Marty Chin, this is a list of 3DO games currently available
... not counting *REALLY* new releases ...

AD&D Slayer
Alone in the Dark
Battle Chess
Burning Soldier
Corpse Killer
Cowboy Casino
Club 3DO Station Invasion
Crash N Burn
Crime Patrol
Demolition Man
Dragon's Lair
Escape From Monster Manor
Family Feud
FIFA International Soccer
Flashback
Gex
Gridders
Guardian War
Hell
Immercenary
Iron Angel of the Apocalypse
JAMMIT
John Madden Football
Jurassic Park Interactive
Lemmings
Mad Dog McCree
Mad Dog McCree II
MegaRace
Microcosm
Myst
Need For Speed
Night Trap
Novastorm
Off-World Interceptor
Out of This World
PaTaank
Quarentine
REAL Pinball

Return Fire
Rise of the Robots
Road Rash
Samurai Shodown
Seal of the Pharaoh
Sewer Shark
Shadow
Shanghai
ShockWave
ShockWave: Operation Jumpgate
Slam N Jam
Soccer Kid
Star Blade
Star Control II
Star Wars Rebel Assault
Stellar 7
Super STreet Fighter II Turbo
Supreme Warrior
Super Wing Commander
The Horde
The Lost Files of Sherlock Holmes
Theme Park
Total Eclipse
True Golf Classics: Pebble Beach Golf Links
True Golf Classics: Waialae Country Club
Twisted
VR Stalker
Way of the Warrior
Wicked 18
Who Shot Johnny Rock
World Cup Golf

Can you count Peter? I know that it will be hard when you get
past twenty (fingers and toes run out), but try hard. Then publically
revoke your 300+ games statement. Forget it ... you'll duck again, just
like a spineless coward.

: Atari's Jagflop is dead. Just because there is stock left doesn't mean that it
: will be around forever. Now that the 3do consoles are below $300 now, more
: stores will clear out what ever excessive Jagflop inventory is sitting around..

I doubt there is much excessive Jaguar inventory. As for the 3DO
price, do you *HONESTLY* think Atari won't counteract with a price cut?
Pardon me for asking such a silly question ... you don't think at all.

: Atari is barely alive.

Atari has 70 million in cash in the bank, but plenty of
investments. At last count, the 3DO cash reserves were down to about $30
million. If Atari is barely alive, what is 3DO?

Sure Atari can will be around even at a miniscule size.
: Atari has only 100 employese worldwide. Not enough to properly run a company..

Actually, Atari has about 130 people and a *LOT* of contracts
with outside firms.

: WorldWide 3do is far ahead of the Jagflop..

Because of all those Japanese porno games. In Europe, the Jaguar
is ahead. In the states, it's pretty close, with a slight edge to the 3DO.

: Wow, Atari sold one million Lynxflops in a five year period while the lame boy
: exceeded over 10 million units..

Lameboy sold well, partly because Nintendo bullied around stores
that carried products by the competition and developers that wanted to
develop for the competition. This was illegal and several people sued
Nintendo over it. By the time the dust settled, it was too late for the
Lynx. Sure, Atari could have advertised much more, but the Lynx fiasco
wasn't totally their fault either.

1970. Re: ATARI & The great debate!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-07-02 00:00:00 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3t4qm6$5r4@ccshst05.cs.uoguelph.ca>
Source record: 12171

```
: When it comes to those who don't understand or have the reasoning to
: understand why Atari has lasted so long. This is for you. I have been
: using them from the begining 400 thru to the ST's. And as far as I am
: concered they are still a good machine.

Atari machines have always been ahead of their time. Last summer,
my friends were blown away when I showed them digitized, color pictures
on a 130XE which had a graphics chip designed in 1981. My friends were
floored when they saw an ST doing everthing a Mac 512K could do at a
quarter of the price. The Lynx was a masterpiece and the Jaguar was a
humungous step up from the Sega and Nintendo machines. Although it has
now been surpassed by the PSX and Saturn, these machines are *SLIGHTLY*
better, not leaps up like the Jag was on the 16-bitters. Whatever Atari
bombs in the marketing department, one cannot accuse them of being an
uninovative company. I think that Jack Tramiel always has good ideas, but
the company has trouble executing them. It was his idea to make the ST a
powerful machine that the people could afford. It was his idea to have
the Jaguar built in the US, even though overseas development would have
been cheaper.

Not to defend Peter, but rather to correct your statements, there are indeed over 200 titles available for the 3DO. 3DO co. released an official press release stating so a few months back.

What skews the title count is that Japanese-only titles are included, and to be fair, you can buy and play them on your USA 3DO if you really want to.

You're missing a huge difference between 3DO and Atari: 3DO doesn't have the overhead or materials costs involved in manufacturing units. They are primarily a R&D company.

Source record: 12177

> BobR, Here is a serious question with no name-calling or flames (imagine
> that!). When did Atari build an integrated keyboard/monitor machine? Did
> this ever escape to the public?

Scott, Atari never had a computer model with both keyboard and monitor in
the same case.

What they did have was a monitor and disk drive in one integrated case
(I can't remember the model number though... PTCsomething..?)

It was only made for a short time and was dropped very quickly. One problem
was that the disk drive was only a single sided unit, and no one wanted one
of those.

During the time it was available I helped Atari Corp set up their exhibit
space at quite a few AtariFests around the country (I ran the GEnie booth
in the Atari exhibit space), and we used these integrated monitors very
extensively. It was VERY nice to be able to just pull the unit out of a
box, connect one power cord to an AC outlet, and run the floppy and video
lines to the ST. It helped eliminate some of the "cord clutter" and
separate power supplies dangling all over the place, made for a nicer looking
setup, and was a lot easier to unpack and pack up again.

In fact, it would have been even nicer if there HAD been a fully integrated
ST system..!

BobR

1977. Comments On Cubase Audio/Falcon?

Newsgroup: comp.sys.atari.advocacy
Date: 1995-07-02 00:00:00 UTC

[Article crossposted from alt.music.midi]
[Author was selah]
[Posted on 2 Jul 1995 14:54:03 -0700]

can you please give me your comments, pros and cons ,
about cubase audio and the atari falcon?
you see i have the falcon and for 300.00 can gwet cubase audio.
i have four megs ram and 86 h/d.
i was told to buy AV quality hard drive (gig or more)
AV meaning that the platter (disks) will be of composite type material so
as
not to expand thermally like metal disks do.
the reason being that when reading or writing to the disk, calibration of
sectors needs to be flawless as much info is being transfered while doing
audio or digital recording.

DO ANY OF YOU HAVE A FALCON USING CUBE AUDIO? are you pleased?
i would appreciate hearing from europe as i know you guys are big on atari.
thank you.

As usual, you do not read carefully. My question is why does Atari feel they have to lower the price even further. Doesn't Atari have the confidence that the Jagflop is as equal as the 3do?

>

That maybe the case in Canada, but where i live 3do consoles are plentiful and
the price is $299 with two packins. Plus Goldstar has a $50 additional rebate.
Lets do the math, with the rebate makes the console $249.

Yes, but feel like 4 or 5 when the classes meet daily for two months instead of the usual four month semester.

: As I said before, that 3do titles have approached 300, GET OVER IT!

Jesus Christ ... is this guy a brainless idiot or what? I list
the goddamn games available for the 3DO in North America ... the ones he
can buy without paying to import rarities, and he ducks it completely.
Hey Peter ... there are about 70 titles on that list. You are 230 games
short. Why don't you get over it?

: I never said that that Atari would not counteract with a price cut. Just shows
: you that Atari does not have faith in the Jagflop.

What does Panasonic have in faith towards the 3DO? It debuted at
$700 and is now selling for less than half the price! I can buy a Sega
Genesis for $89.95 Canadian. When they came out, they were $300! I guess
Sega has no faith either, eh?

Why does Atari always
: counteract to their competitors and not the other way around.

How clueless can we be Peter? Reread your Atari history.

: And dwindling.. WOOOOPEEE, 70 million is pocket change. Not exactly that
: Atari has set the world on fire with that 70 million.

You ducked the question again, you spineless fool. With only
about $30 million in the band, what does that leave 3DO? Answer please?

: Again, that is a redicolous low head count to be viable. Just shows you that
: Atari is not serious about the video game market and the same old tricks are in
: place.

Atari is like any other company ... serious about survival.

: Porno, eh? Goto check that out..->

Why does that not surprise me?

: Quit making excuses for Atari. The Lynx flopped due to Atari's ineptness.

Once again, good old Petey missed all the points I made. Can we
say dillusional, boys and girls?

BTW ... as much as I like the 3D0, rocky times are ahead for it
too. Outside of gaming stores, it was being carried in a few nationwide
chains such as "The Bay", "Compucentre" and "Radio Shack." All three
chains are in the process of clearing it out.

::sigh:: Fine, if you don't believe me. Here's the official 3DO press release:

.....

Software Library Swells to 200 Titles
==========

Currently, 200 distinct 3DO titles have been released worldwide, and an additional 185 titles are in development. Recently released hit titles include GEX, Myst, and Return Fire. Many highly anticipated titles are scheduled to be available for the 3DO system this year, including EA Sports Presents: NHL Hockey 96, Foes of Ali, BladeForce, POed, Wing Commander III: Heart of the Tiger, Doom, and Primal Rage.

"With the best price, the best bundles, and the best software catalog, 3DO is in a very strong competitive position for 1995," said Hawkins.

The unprecedented power and performance of 3DO hardware and software provides consumers with the most realistic and engaging experience available on any of todays advanced CD systems. 3DO hardware and software products have won numerous awards and accolades from industry experts, retailers, and consumers, including Best System of 1994 from more than five publications. The company recently unveiled its highly anticipated, next-generation 64-bit M2 technology, designed to create a quantum leap in advanced CD entertainment technology.

Additional information on 3DO hardware and software products is available through 3DOs World Wide Web site, located at http://www.3do.com, and on the America Online 3DO Forum by entering the keyword "3DO."

Based in Redwood City, Calif., The 3DO Company (NASDAQ:THDO) develops and licenses advanced interactive technology to hardware and software companies worldwide. The companys award-winning product design, the 32-bit 3DO Interactive Multiplayer system, was created to deliver a breakthrough in interactive entertainment at an affordable price. The current 3DO system is available worldwide from Panasonic, Goldstar, Sanyo, and Creative Labs.

# # #

3DO, the 3DO logos, and Interactive Multiplayer are trademarks and/or registered trademarks of The 3DO Company. All other brand or product names are trademarks or registered trademarks of their respective owners.

Agreed. However the games far outweigh the other kinds of titles combined
-- I don't know why people make such a big deal out of them.

When you look at the reality of the situation, there are a lot of games
available for the 3DO. Some may suit your tastes, so may not.

Yo!

Clearly not an all time favorite -- however -- I just got done with my first six hour session of Wing Commander III for the 3do. Wow, what a game. I'm hooked -- even if it looks like Mark Hamil needs to go from Betty Ford to Weight Watchers. (Not so coincidentally, my guy's monniker is "Paunchi.")

Yes, there are some titles on the shelves for 3do that the "normal" video gaming audience has very little interest in. I suspect these will eventually be on the "ultra mega clearance" racks. However, it is safe to say that there are many fun games for the 3do.

Finally, owning both a 3do and Jaguar, it is true for me that I have enjoyed more games on the 3do than there are games available for the Jaguar. So even if every Jag game were perfect for me and really fun, my 3do would, to date, have been more enjoyable.

Anyway,
-Chris

Hi all!

Okay, I got, IMO, into PEECEE's painfully late in the game. About 2 to 3 years ago. At anyrate, I've decided that I need to READ READ READ whatever books I can get my hands on. It's my summer project. (:

At anyrate, along with going to the library to look up magazines and articles for like the last 10 to 15 years, I'd much prefer to read books.

I'm currently reading the book _Hard_Drive_ by James Wallace & Jim Erickson ((c) 1992 Harper Business.) I'm only on page 374 of the book, so don't anyone spoil the ending for me! (;

The more and more I read, the more and more I am SO GLAD I am not a supporter of Micro$loth. But that is only one book. And to be fair, I should probably read others about him.

My whole point is that I want more like "history" type books without the "textbook" feel, about the industry itself. I liked the way this book read (more of a compliment to the authors rather than the subject.) The whole PEECEE business is still a "baby" business, only 15 or so years old.

I am interested in Amigas, IBM, Apple, and how that whole creature was created,
the history of operating systems. It would be really cool if I could read the whole developement history of OS/2, and other major companies and software developers. I only know some people like Ed Roberts, Gates, Wozniak & Jobs. Now atleast I know about Kildall, and what is meant when people mention CP/M.

I'd love to know the history of all this, the major players in what we now know of in the industry, to catch up to speed of everything that's going on. I'm also really interested in the history of personal computers, and how they got started, what companies have done what as far as their contributions to the PC world.

If you have a favorite book, or one you feel would be incredibly informative, please post it, or email me. I would probably eat up the information I get. Thanx for helping to educate another PEECEE user. (:

I loved Gates , although I can't remeber the author right now...
Excellent, almost inspiring , reading material. Basically walks you thru
Bill Gate's life from the start until about 1993. For those of you who
don't know... computer history is the history of Bill Gates. I know this
pains some of you (it kinda pains me too) but it is a fact. Microsoft was
the FIRST software company...EVER!!!! Computing would be a very different
place without Bill around... might be better... who knows. Anyway, its a
great book... has a picture of Bill on the cover (that doesn't make it
great, but since I can't remember the author I gotta give you something to
identify it with... although just his face might not be too helpful). I
would advise anyone who is into Micro$loth bashing to read this book and
get a different perspective on things...

Absolute must read- Accidental Empires by Robert Cringely. Utterly
hilarious, scathing book about everyone in the industry. It's a bit
dated now (1991), but I keep hoping he updates it.

Maybe you mean the first PC software company? There were a lot of
applications available for System/360's, System/3x's, VAX's, etc. before
Microsoft was even founded.

I'll second that. Hands down, the most entertaining book about the humble beginnings of the PC is "Accidental Empires". In the short amount of time that the book has been out, the PC industry *has* already changed quite a bit; most notably, Novell and Lotus are less prominent than they used to be. But, hey, the book is about history; it is the single best starting point I can think of. It explains all the major players (Gates, Jobs, Kapor, etc etc) in the PC's birth very well. I can't wait until Cringely writes another book.

Not necessarily the first PC software company, just the PC industry in
general. Like, the "Lisa" from Apple, I never knew about that until my
SO told me about it, now I want to know about it, what and how it ran,
what it was all about, along with other computer systems.

Correction: Microsoft was the first MICROcomputer SOFTware company.

>Computing would be a very different place without Bill around...

Yes. When the first microprocessor came out, none of the big
players believed it had any value, and thought it was a worthless
toy. Gates didn't believe this and ported BASIC to microprocessor,
a feat which everyone else thought would be impossible. Only then
did it start to get respect.

Cheers, Terry Murphy

2003. Analysis: Next 18 Months, P6 Sales Flop

Newsgroup: comp.sys.atari.advocacy
Date: 1995-07-04 00:00:00 UTC
From: bootstrap1@aol.com
Message-ID: <3tc3e3$c03@newsbf02.news.aol.com>
Source record: 12054
Cross-posted to: comp.os.os2.advocacy,comp.sys.amiga.advocacy,comp.sys.mac.advocacy,comp.os.ms-windows.advocacy,comp.sys.atari.advocacy,comp.unix.advocacy,comp.sys.next.advocacy

Well, things are starting to look awfully rocky for the P6 and Windows '95. PC Week reported the following in the July 3rd issue:

"Testing of the preproduction Intel microprocessor shows that Windows 95 runs only about 10 percent faster on P6 than on a high-speed Pentium processor because of the significant amount of 16-bit code in the operating system, according to leading PC makers, who spoke on the condition of anonymity."

ANALYSIS:

If we add this new information to what we've already heard about Win '95, we can make the following analysis.

BIG BUSINESS: Many big businesses have already declared their reluctance to upgrade wholesale to Windows '95, because it will require a significant investment to upgrade the RAM, processors, and hard disks on the computers they already have just to support OS that runs at the same speed as Win 3.1. Plus, it is now clear that Win '95 is an interim OS; there won't be a significant upgrade to Win '95 but rather it will be succeeded by some version of NT (Microsoft is already pushing NT over Win '95 for business users).

Of course, most big businesses *really* aren't ready to upgrade all their computers to 16 MB (probably close to $1000 once the big scramble for more RAM to run Win '95 commences) not to mention the required processor and hard-drive upgrades just so their employees can use a cool 32-bit, protected, preemptive OS like NT for their word-processing, e-mail, and spreadsheets.

In the near term, big businesses are going to stay firmly planted in Win 3.1, although some divisions may upgrade to Win NT. This is evident by Microsoft's reversal on their decision last year to discontinue support for the Win 3.1 version of their business products.

SMALL BUSINESS: Small companies will probably start migrating to Win '95 relatively quickly because the reduced support costs (if they appear) will likely offset the required hardware upgrades. Of course, some may realize that they will only have to upgrade their hardware *again* in a year or two to support whatever version of Win NT that Microsoft is pushing then.

Small businesses may also choose alternative operating systems, and OS/2 will continue to be popular, Likewise, if Apple does a better job at targeting small businesses, some segment of this population may decide i'ts better in the long run to migrate to the Mac.

HOME USERS: Some home users will start migrating to Win '95 relatively quickly because of the cool features and ease-of-use. Naturally, this may be only a relatively small percentage of home users, as many home users have a limited budget for computer stuff and the hardware and software upgrades necessary to use Win '95 well. In addition, so many home users won't switch that home/education software companies will continue to support and upgrade Win 3.1 versions of their software.

Again, home users may also choose other operating systems, with OS/2 leading the pack. Fewer home users that already have a 486 or higher Windows system are going to switch to another computer, such as the Mac, because of the cost involved, but Apple still may be able to convert users currently using MS-DOS alone on older computers.

EDUCATION: Educational institutions are going to remain firmly planted in Win 3.1, because of the cost involved in upgrading all of their hardware. Apple has seen this happen with Macs; a lot of educational institutions even had trouble finding $180 per machine to upgrade to 4 MB for System 7. They really aren't going to be able to afford $400 or more for 8 MB to run Win '95. In addition, and as a result, most educational software is going to continue to support Win 3.1, so the advantages of upgrading are less.

INTEL P6: Based on the analysis of which OS the above market segments will choose, wholesale acceptance of the P6 as has happened with the Pentium is unlikely. Most big business, small business, home, and educational users are going to be using either Win '95 or Win 3.1 in the forseeable future, operating systems for which the P6 will outperform the Pentium by a scant 10%. Hardly worth the cost of upgrading to this new processor.

Yet it was these markets that drove the demand for Pentiums. While OS/2 and NT users may buy be anxious to buy the P6, these users represent a small fraction of the market. For at least the next 18 months, demand for the P6 is going to remain low, Intel will continue focusing on the Pentium as its main processor, and price for P6-based systems is going to remain high.

OS/2 WARP: Anyone buying a P6 is going to want a 32-bit operating system. While NT will likely land a good number of these upgrades, it is also likely that many users will want off the Microsoft upgrade treadmill and defect to Warp, especially if IBM eventually is able to run most Win 32 apps.

Within 18 months, as Pentium-clone manufacturers begin producing their chips cheaper than the Pentium, Intel will begin to push the P6 as their mainstream alternative to the Pentium. Any company producing computers based on the P6 are going to have to bundle OS/2 or NT with their machines. Given the ongoing scrutiny the DOJ will give Microsoft over the next year (at least), expect OEMs to be able to free give customers a choice of OS without incurring any financial hardship due to anti-competitive practicies from MS.

POWER MACINTOSH: Over the next 18 months, PowerMacs will provide increasingly better price/performance than computers running Win '95. Not only will major speed improvements in the PPC 604 translate directly into performance improvements in running native software, but Apple's new 040 emulator will allow better performance for non-native apps. In addition, by the time Copland is released in late '95, much more of the Mac OS will be running as native PPC code.

The better price/performance, coupled with the Mac's legendary ease-of-use and widely recognized brand name, will increase the Mac's appeal with first-time computer buyers and may even win some converts who are tired of living under the MS/Intel umbrella. Of course, that's assuming Apple can get its marketing guys in gear.

POWERPC: The folks upgrading to the P6 over the next 18 months are going to be power users, for the most part. They are going to have to switch from the Win 3.1 or Win '95 OS they are likely currently using to OS/2 or Win NT. They are going to have to ugprade all their apps to get the most performance bang for the buck. It's not going to be hard to see the advantages offered by the CHRP platform over the 15-year-old PC-compatible platform. Plus, there is the bonus of being able to run any Macintosh app. The CHRP platform is going to become increasingly inviting.

That's it. Flame away. Even if you don't buy all of the analysis, it's pretty clear that the P6 is going to pretty much be on the back-burner until '97, since most analysts estimate that only about 10 million users are going to upgrade to Win '95 by then, and far fewer than that are going to consider upgrading to OS/2 or NT in that time frame. And yet Intel insists that the P7 will be out in '97; that may be, but at this rate we'll be lucky if it hits the mainstream before the millenium.

(article deleted)

Your whole "analysis" is based on two and possibly a third basic "facts"
none of which are true.

1) That the P6 is just waiting in the wings, and will begin replacing
Pentiums in shipping units in large numbers over the next 18 moths.

I find no support for this idea at all. It is likely that it will take a
couple of years before you will see any significant penetration of the
desktop market with P6 units. Many people have just upgraded to Pentiums,
new Pentiums are just coming out, etc. The P6 is "announced," and it will
ship, but it won't be comonplace in anything like the time frame you
suggest.

2) That using Win95 necessitates a significant upgrade of equipment,
money, software, and especially memory.

Again, no support at all. The people using Win95 now, report that it runs
about the same speed as Windows 3.1 in the same memory, it also runs
almost every Win16 program you want to throw at it, and runs it better
than Win3.1. the total cost of the upgrade to Win95 is about 100.00 unit
and a little education, not hundreds of dollars of additional memory and
so on that you claim.

3) Your argument is not realy "based" on this one, but itdoes include the
idea that Mac's are an Up and Coming alternative for many home users, with
this I would disagree in the sense that you imply that a Windows 3.1 user
would switch to a Mac when faced with a choice between Win95 and Mac/OS.
This is a joke right? The Win95 upgrade is a no-brainer for people like
this, they will never chose Mac over win95.

No flames here, just a comment: you could replace all references to the P6
with a reference to Pentium, and it would be the same sort of stuff people
were saying a year ago. While I am not convinced that the road will be
smooth for MS and Intel in the near term, many of their competitors have
underestimated them before - and many of them are no longer the thriving
businesses they used to be.

There are windows of opportunity here for everyone; whether anyone has the
courage to take advantage of them is an open question.

Oops, sorry, that was a typo; thanks for catching it. The best
projections for Copland are that it will be out in mid-96, but late 96 is
probably more realistic. The improved emulator is already out; it shipped
with the 9400.

Well, it is a fact that the P6 is waiting in the wings, in that it is supposed to start shipping in PCs late this year. In reality, I don't think it is a fact that the P6 will be shipping in large numbers over the next 18 months; that was kinda the point of my analysis. However, chips with similar or better performance than the P6 and targeted at the PC market (primarily the 604) are shipping now and will be shipping in large numbers over the next 18 months. That's why I say P6 sales will flop.

This may shock you, but most of the people using Win 3.1 today are using it in 4 MB of RAM (kinda scary since the OS eats up most of that) and 4 MB machines were what most businesses and consumers were buying even a year ago. These people certainly aren't power users, but they are being productive and could benefit greatly from Win '95. However, Win '95 *isn't* going to run at all acceptably in 4 MB. 8 MB is the minimum from most people's standpoint, and I think there is a reason that some magazines are recommending 12 MB. A '486 or Pentium is also recommended, and yet there are lots of folks out there running Win 3.1 on 386 machines.

And while I agree Win '95 runs almost every 16-bit app you throw at it (except for the 250 mainstream apps quoted by Microsoft), what's the point? These apps will strangle the preemptive multitasking capabilities of Win '95 whenever they are run and have the ability to make Win '95 very unstable. You've just lost the two big advantages. That leaves the user-interface improvements, but you can have those now with Win 3.1 at third-party software add-ons.

My mistake, I thought you were saying that the P6 would be readily
availaable soon and thus impact on Win95's acceptance due to the 10%
thingie. I should say that I don't necessarily believe this ten percent
imporvement scenario either unless you can give me a reference to where
you got it from. Several of your facts below are innacurate enough to
make me wonder about that.

Again, i think you are confusing the recommendations of a computer magazine writer's idea of "acceptable" and what people actually use. Most people out there *do* still have only 4megs and Win95 will run at the same speed level that Win3.1, (which presumably they are running now), does. There have been many posts to this effect both here and on MSN from people who normaly ran Windows 3.1 in 4Megs, that Win95 runs the same or faster. The only thing it's bad on is a 386 SX.

> And while I agree Win '95 runs almost every 16-bit app you throw at it

This tells me that you have been reading alot of what IBM puts out about Win95 which is less than accurate. The idea that running a mix of Win16 and Win32 apps, (normal, well-behaved ones) "strangles" or stops multitasking under Win95 has been around for a long time, but it is not true at all. All apps multitask quite smoothly unless you run into a bad app that locks the Mutex which is the same as in Windows 3.1. The apps it won't run are only 200 BTW out of about 3500 "mainstream" apps and who knows how many others.

Does anybody know if there's a newsgroup that posts Atari machines for sale?
I'm planning to part with my old system. It's been collecting dust ever since
I left for college. Any suggestions will be welcomed.

Please respond to kua97@uno.cc.geneseo.edu

Regards,
K.K.

Here's the following for sale - US$700 o.b.o.:

* Atari 1040ST, dual drive system (one internal, one external), mouse and
all necessary cabling.

* Color monitor (SC 1224).

* Spectre GCR emulator cartridge. It gives a basic Mac Plus equivalent and
reads/writes to Mac formatted disks. (I'll include Mac software for word
processing if interested).

* IMG Scanner (cartridge based scanner to work in conjunction with the printer).

* Yamaha PSS 680 MIDI keyboard (with cables to attach for use with Music
Studio)

* Star NX-1000 dot matrix printer (with all my unused ribbon cartridges)

* I'll include my whole library of Atari ST disks (all my software collected
over the years).

FINE PRINT:
It is in great condition and I'd like to sell it as a complete whole if
possible. I'm in the New York City area and will consider selling outside
NYC if you're willing to pay for shipping. Price is negotiable...
Please e-mail directly.

Regards,
K.K.

2014. Cheap Falcons

Newsgroup: comp.sys.atari.advocacy
Date: 1995-07-04 00:00:00 UTC
From: rob@rgcasey.demon.co.uk
Message-ID: <804889160snz@rgcasey.demon.co.uk>
Source record: 12065

Now that C-Lab are producing the Falcon MkII, I have heard that they are looking at a cut down mass market version. Does anyone know of this, or the rumour that Atari are refusing them to do this until they have sold all their own existing stock? If this is true then the three stooges want shooting. They've done bugger all for their loyal users and this would be the icing on the cake.

A cheap Falcon would be ideal - especially now that Escom are going to be able to bridge the price gap with the Amiga. Chain stores like Dixons, Currys et al will have nothing to compare. The amount of good Falcon specific stuff is slowly increasing and so I think its actually in a better position now, than when it was launched. What would be even better would be for Atari to go bankrupt (they have no effect on their computers anymore) and a for a big player to step in (eg Dell), buy everything for a pittance and aggressively sell it.

A bit like Commodore really.

```
: As usual, you do not read carefully. My question is why does Atari feel they
: have to lower the price even further. Doesn't Atari have the confidence that
: the Jagflop is as equal as the 3do?

Price wars are the name of the game. If you don't like it, move
to a communist state. *EVERYONE* lowers there prices in response to the
competition. Nintendo, Sega and 3DO have all lowered their prices
substancially from the original list prices. They must not have
confidence either. The 3DO originally went for $699 US. Then it was
dropped to $399. Now $299. Panasonic must really hate their poduct.

: Isn't 3do just a R&D firm? I thought Panasonic and GoldStar handle
: manufacturing, distribution and marketing?

3DO does marketing of it's own. They also program games, print
disks and design the upgrades.

: Lets do the math: Panasonic and GoldStar have billions in cash on hand..

Yes. And they got that way buy keeping up profitable lines. With
the 3DO (an expensive machine to build) going for such a low price, they
aren't making the same $$$ they used to on it.

: That maybe the case in Canada, but where i live 3do consoles are plentiful and
: the price is $299 with two packins. Plus Goldstar has a $50 additional rebate.
: Lets do the math, with the rebate makes the console $249.

Then you are lucky. Here, I'd love to get a 3DO, but paying 2 1/2
times as much for a machine that seems just as likely to fade away seems
stupid. At least I know where to look for Atari stuff when the Jaguar
falls off the shelf.

This is simply fud, bs, crap. Another person who has no fucking idea
what their talking about. Windows 95 will be followed by Windows
96(dubbed Nashville) and later updates, eventually it may become more
powerful and robust, but it will never be NT. Win95 will continue to
be a "light" version of Windows for the Home user and NT will kepp
getting more power features for the power user, while some of its
features will tricke down to Win95.

Copland is due out in 96 and that due date has stuck for quite some time.
Win95 was originally due out by 93. Let's not talk deadline...MS/Intel
tend to lose those arguements. <G>

Sorry, I mispoke. I wasn't trying to suggest that Microsoft wouldn't continue supporting Win '95, or provide upgrades of any kind. We all know there is a bug-fix-updated coming out this fall and I'd expect that Microsoft would continue coming out with updates to improve the human interface, add features, fix bugs, bundle more apps to squash the competition, etc.

However, it sounds like, architecturally, Win '95 is pretty much going to be the end of the line. As you point out, Microsoft has now changed its tune and is aiming Win '95 at the home market, while aiming Win NT at corporate desktops. It is hard for me to believe that Microsoft is going to provide much in the way of development resources to radical improvements to Win '95. From what I've read, I'm hardly alone in that viewpoint.

On top of that, we have the following quote from the same PC week article I quoted originally:

"Meanwhile, Microsoft officials say they have no immediate plans to optimize Windows 95 for the P6. We have no [fall] refresh planned for Windows 95 that would optimize it for the P6," said Yusuf Mehdi, Windows 95 product manager with Microsoft's personal systems division in Redmond, Wash."

Sounds to me (my opinion) like they don't have any P6 refresh planned, period. The only P6 optimization that counts is converting all the Win '95 code to 32-bit. The reason Microsoft has given for not already making all of Win '95 32-bit is compatiblity with existing apps and, until most apps are Win32, that reason isn't going to go away. Maybe this will happen a few years down the line, but certainly not in the next 18 months. And a few years down the line, I'm guessing that Microsoft will be pushing Win NT (or some derivative) for everyone.

Well, I agree with you in all your estimates of the fact that most people will be buying more RAM and that alot will take the opportunity to upgrade the Hard Disk as well. However...

If the issue is whether or not they *need* to do this as a result of Win95 having some increased requirements I still don't see where you get this from. If they were happy running all those apps in Win3.1 in the same memory, they should get comparable performance under Win95. The disk I/O

is now 32 bit, the swap file is more intelligent and also faster, samrtdrive is now replaced by a 32 bit cache, etc. etc. Overall Win95 is tha same or faster than even WFW3.1 let alone Windows 3.1 itself. People *will* upgrade their memory and disk space like they always do, and win95 will be the excuse, but I think that experience should be uncoupled from the issue of whether Win95 *needs* more memory or Harddisk space.

The fact that there will be all those free Betas of MS Office/95 floating around will certainly convince people to upgrade for sure.

Jeremy

Thanks, read it just as I got to this message. (I was smoothly
multitasking my multithreaded Win95 Netscape app at the same time as the
16 bit newsreader over a SLIP connection) Still, if you are going to buy a
P6 machine, you will want 16 or 32 megs of RAM and probably EDO memory,
Triton chip set etc. So why this kind of system would be running Win95
anyway is beyond me.

Two others are _Big Blues_ (Carroll) and _Accidental Empires_
(Cringely). An earlier account is _Fire in the Valley_ (can't
remember the author).

Of the relatively recent accounts, _Accidental Empires_ appears the
least biased: Cringely isn't nice to anybody :-). _Big Blues_ sheds a
pretty favorable light on Microsoft most of the time; _Hard Drive_ is
the other extreme.

Intel's made their intentions very clear, the P5-75 is their low end
CPU today.

>2) That using Win95 necessitates a significant upgrade of equipment,
>money, software, and especially memory.
>
>Again, no support at all.

MS recommends 8MB and 12MB for running MS OFFICE as a minimum. Most
Trade rags recommend 16MB. The typical PC will need 4-8MB of
additional RAM and of course Win95's Plus Pack requires a 486 minimum--
no 386's. Lastly MS's newest multimedia standard is built around a p75
CPU as the recommended minimum CPU.

It may be FUD and IBM talk. On the other hand, PC World, July 95, in
the "Windows 95 Adviser" column by Richard Freedman, "a former group
manager on the Windows 95 team at Microsoft", writes that all he could
do was "twiddle his thumbs" during a long calculation in 16-bit Excel.
"In my experience", he writes, "32-bit applications are better multi-taskers".

>so on that you claim.

I will have to disagree with you, Jeremy. Anyone without 8MB (most people)
will have to buy more RAM. Anyone with less than a 350MB hard disk will
have to buy more disk. If they want to run more than Word 2.0 and Excel 4.0.

Word 6.0 and Excel 5.0 on a 4MB system with 210MB of hard disk will not
be a pretty sight. Where will you put the Win95 swap file - for a start?

Lots of people have already upgraded the RAM.....but not the disk. Either
way, we are looking at Win95 from a software cost + h/w upgrade cost
perspective. OS/2 has suffered from this for the past 3 years. Now
Win95 can join the club. Home users can't and won't fork out big tin
just to upgrade..........unless they have no choice. That day is a long
way off yet. OS/2 is there for them when they are ready.

An older book that I think is worth reading (even though it's Apple
specific) is Accidental Millionaire. It's a rather scathing look at
the Steve Jobs years at Apple which should be pretty important to
anyone interested in micro-computer history.

While not specific to PC's, Steven Levy's "Hackers" is a superb read.
Easily the most enjoyable book I've read dealing with computer history.

Enjoy!

Actually for the 8-bit market it was Digital Research, with CPM and
CBASIC back in the S-100 bus microcomputer days. MBASIC appeared
later. PC/MS-DOS didn't appear until the first IBM PCs rolled out.

But then if you really want to split hairs, it would go to Datapoint
with their 8-bit processor back in 1974, but they called their system
a 'mini'.

>Tim LaDuca <laducat@fit.edu>

Very correct Tim. People are correct in that there will be no
major upgrade to Windows 95. The next major upgrade in the Windows world
(besides NT) is Windows 96. There is supposed to be two upgrades in the
tunnel to follow Win95, one called Memphis, and the other Nashville. I
cant remember which is coming first. After that point, NT and the
Windows 95/96/97 line will merge (supposedly) into one product, or at
least one code base with two seperate products off of it (one low end,
and stripped of features, and one highend, the NT we know today).

The same place. Read above where it says "significant penetration", then
think about how many people are even using Pentiums (P5) yet. It will be
a long while before there is a large scale switch to P6 computers, it is
more likely that there will be a significant number of 486 computers still
in regular, "mainstream" use even at the *end* of the P6 cycle.

This is why MS's strategy is so good, they will have two different, but
essentialy (to the consumer) identical OS's each optimized for different
hardware levels. It's called covering your bets and it works.

Jeremy.

You assumption that OFFICE users have the memory needed is incorrect.
Win95 has a larger footprint. 8MB users aboundand that's not enough
for win95.

>The plus pack is and
>always was intended as an add-on for 486 and P5 based computers. Again, this
>has no bearing on the requirements for Win95, it's an *add-on* right?.

It's an addon that demonstrates what Win95 will need to run well.
You've also admitted that the addons include some of what MS promsied
for Chicago but later put in the plus pack.

>Lastly, multimedia standards are typicaaly teleological goals when they are
>first introduced based on "ideal" entry level computers at the time of their
>adoption. No conflict there either.

Incorrect statement. The recommendations are what developers target for
their apps NOW. Win95 users will need NEW software and what will they
find? Stuff made for the p75 with 16MB of RAM.

If you have a substandard system then you have problem. A 486 is a
substandard system and so is 8MB. Not so under OS/2 WARP.

>CPU as the recommended minimum CPU.

All very interesting, but off the point. Everyone knows if you want to run
office you need mucho memory, if joe user is running it on Win3.1 right now,
he would already have said memory, therefore no upgrade necessary to switch to
Win95, if joe user is not running office now and wants to under win95, they
will upgrade memory, but because of office, *not* win95. The plus pack is and
always was intended as an add-on for 486 and P5 based computers. Again, this
has no bearing on the requirements for Win95, it's an *add-on* right?.
Lastly, multimedia standards are typicaaly teleological goals when they are
first introduced based on "ideal" entry level computers at the time of their
adoption. No conflict there either.

PC Week, July 3, 1995, page 1:

Slight performance gains on P6 may not warrant OS upgrade

by Lisa DiCarlo

When Intel Corp.'s next-generation P6 processor arrives in systems
late this year, it will offer only meager performance gains when
running Windows 95, leading many PC makers--and corporate buyers--
to bypass the new operating system in favor of Windows NT or OS/2
Warp.
Testing of the preproduction Intel microprocessor shows that
Windows 95 runs only about 10 percent faster on P6 than on a
high-speed Pentium processor because of the significant amount of
16-bit code in the operating system, according to leading PC
who spoke on the condition of anonymity.
...
Intel officials make no apologies for the P6's performance on
16-bit operating systems.
...
Meanwhile, Microsoft officials say they have no immediate plans
to optimize Windows 95 for the P6.

>The apps [Windows 95]
>won't run are only 200 BTW out of about 3500 "mainstream" apps and who
>knows how many others.

Yeah, and those troublesome apps are such insignificant, hardly used things, like Microsoft Mail 3.2, Corel Draw, Corel Photo Paint 5, and cc:Mail, vastly outnumbered by such mission-critical software as DOOM][and Pinball. (I'm giving Microsoft the benefit of the doubt by assuming those *do* run.)

(Geez, they must have REALLY screwed up big-time if they couldn't sneak enough exceptions in to make one of their _own_ applications squeak through.)

->Well, things are starting to look awfully rocky for the P6 and Windows
->'95. PC Week reported the following in the July 3rd issue:

->"Testing of the preproduction Intel microprocessor shows that Windows
->95 runs only about 10 percent faster on P6 than on a high-speed
->Pentium processor because of the significant amount of 16-bit code in
->the operating system, according to leadi

You'd better start reading. Intel has already announced that it will begin shipping the P6 before the end of this year. So where does that leave the rest of your analysis?

Microsoft was the first company to offer software for microcomputers...
you know, the machines that ushered in the computer revolution? Mainframes
of the 70's were not then, and are not now, a compelling or dynamic market
for software.

Paul

Bootstrap1 (bootstrap1@aol.com) wrote:
: Well, things are starting to look awfully rocky for the P6 and Windows
: '95. PC Week reported the following in the July 3rd issue:

: "Testing of the preproduction Intel microprocessor shows that Windows 95
: runs only about 10 percent faster on P6 than on a high-speed Pentium
: processor because of the significant amount of 16-bit code in the
: operating system, according to leading PC makers, who spoke on the
: condition of anonymity."

Who gives a SH*T!!! This is Amiga advocacy. Get off or get thrown off!!!!

: ANALYSIS:

: If we add this new information to what we've already heard about Win '95,
: we can make the following analysis.

: BIG BUSINESS: Many big businesses have already declared their reluctance
: to upgrade wholesale to Windows '95, because it will require a significant
: investment to upgrade the RAM, processors, and hard disks on the computers
: they already have just to support OS that runs at the same speed as Win
: 3.1. Plus, it is now clear that Win '95 is an interim OS; there won't be
: a significant upgrade to Win '95 but rather it will be succeeded by some
: version of NT (Microsoft is already pushing NT over Win '95 for business
: users).

: Of course, most big businesses *really* aren't ready to upgrade all their
: computers to 16 MB (probably close to $1000 once the big scramble for more
: RAM to run Win '95 commences) not to mention the required processor and
: hard-drive upgrades just so their employees can use a cool 32-bit,
: protected, preemptive OS like NT for their word-processing, e-mail, and
: spreadsheets.

: In the near term, big businesses are going to stay firmly planted in Win
: 3.1, although some divisions may upgrade to Win NT. This is evident by
: Microsoft's reversal on their decision last year to discontinue support
: for the Win 3.1 version of their business products.

: SMALL BUSINESS: Small companies will probably start migrating to Win '95
: relatively quickly because the reduced support costs (if they appear) will
: likely offset the required hardware upgrades. Of course, some may realize
: that they will only have to upgrade their hardware *again* in a year or
: two to support whatever version of Win NT that Microsoft is pushing then.

: Small businesses may also choose alternative operating systems, and OS/2
: will continue to be popular, Likewise, if Apple does a better job at
: targeting small businesses, some segment of this population may decide
: i'ts better in the long run to migrate to the Mac.

: HOME USERS: Some home users will start migrating to Win '95 relatively
: quickly because of the cool features and ease-of-use. Naturally, this may
: be only a relatively small percentage of home users, as many home users
: have a limited budget for computer stuff and the hardware and software
: upgrades necessary to use Win '95 well. In addition, so many home users
: won't switch that home/education software companies will continue to
: support and upgrade Win 3.1 versions of their software.

: Again, home users may also choose other operating systems, with OS/2
: leading the pack. Fewer home users that already have a 486 or higher
: Windows system are going to switch to another computer, such as the Mac,
: because of the cost involved, but Apple still may be able to convert users
: currently using MS-DOS alone on older computers.

: EDUCATION: Educational institutions are going to remain firmly planted in
: Win 3.1, because of the cost involved in upgrading all of their hardware.
: Apple has seen this happen with Macs; a lot of educational institutions
: even had trouble finding $180 per machine to upgrade to 4 MB for System 7.
: They really aren't going to be able to afford $400 or more for 8 MB to
: run Win '95. In addition, and as a result, most educational software is
: going to continue to support Win 3.1, so the advantages of upgrading are
: less.

: INTEL P6: Based on the analysis of which OS the above market segments will
: choose, wholesale acceptance of the P6 as has happened with the Pentium is
: unlikely. Most big business, small business, home, and educational users
: are going to be using either Win '95 or Win 3.1 in the forseeable future,
: operating systems for which the P6 will outperform the Pentium by a scant
: 10%. Hardly worth the cost of upgrading to this new processor.

: Yet it was these markets that drove the demand for Pentiums. While OS/2
: and NT users may buy be anxious to buy the P6, these users represent a
: small fraction of the market. For at least the next 18 months, demand for
: the P6 is going to remain low, Intel will continue focusing on the Pentium
: as its main processor, and price for P6-based systems is going to remain
: high.

: OS/2 WARP: Anyone buying a P6 is going to want a 32-bit operating system.
: While NT will likely land a good number of these upgrades, it is also
: likely that many users will want off the Microsoft upgrade treadmill and
: defect to Warp, especially if IBM eventually is able to run most Win 32
: apps.

: Within 18 months, as Pentium-clone manufacturers begin producing their
: chips cheaper than the Pentium, Intel will begin to push the P6 as their
: mainstream alternative to the Pentium. Any company producing computers
: based on the P6 are going to have to bundle OS/2 or NT with their
: machines. Given the ongoing scrutiny the DOJ will give Microsoft over the

: next year (at least), expect OEMs to be able to free give customers a
: choice of OS without incurring any financial hardship due to
: anti-competitive practicies from MS.

: POWER MACINTOSH: Over the next 18 months, PowerMacs will provide
: increasingly better price/performance than computers running Win '95. Not
: only will major speed improvements in the PPC 604 translate directly into
: performance improvements in running native software, but Apple's new 040
: emulator will allow better performance for non-native apps. In addition,
: by the time Copland is released in late '95, much more of the Mac OS will
: be running as native PPC code.

: The better price/performance, coupled with the Mac's legendary ease-of-use
: and widely recognized brand name, will increase the Mac's appeal with
: first-time computer buyers and may even win some converts who are tired of
: living under the MS/Intel umbrella. Of course, that's assuming Apple can
: get its marketing guys in gear.

: POWERPC: The folks upgrading to the P6 over the next 18 months are going
: to be power users, for the most part. They are going to have to switch
: from the Win 3.1 or Win '95 OS they are likely currently using to OS/2 or
: Win NT. They are going to have to ugprade all their apps to get the most
: performance bang for the buck. It's not going to be hard to see the
: advantages offered by the CHRP platform over the 15-year-old PC-compatible
: platform. Plus, there is the bonus of being able to run any Macintosh
: app. The CHRP platform is going to become increasingly inviting.

: That's it. Flame away. Even if you don't buy all of the analysis, it's
: pretty clear that the P6 is going to pretty much be on the back-burner
: until '97, since most analysts estimate that only about 10 million users
: are going to upgrade to Win '95 by then, and far fewer than that are going
: to consider upgrading to OS/2 or NT in that time frame. And yet Intel
: insists that the P7 will be out in '97; that may be, but at this rate
: we'll be lucky if it hits the mainstream before the millenium.

Hmmm, I do think you are mistaken. While there are plans to release
nashville and memphis, perhaps as win96 and win97, the definite
direction for MS is to eventually merge the two products which imho
will mean dumping the win95 architecture in favor of NT's.

And as far as the business users go, win95 was indeed envisioned as the
corporate client os as well as for the home. What we're seeing now
is a repositioning of win95 to the light duty and home user because
it simply isn't up to the job I and others thought it was originally
intended for. To me this is similar to the repositining of NT as the
server os to compete with unix when it became apparent that it was
to large to be a workstation os. And now we see NT being repositioned
as the corporate desktop to take up the slack for win95's shortcomings.
This isn't actually that bad a solution as NT is indeed more efficient
than it originally was, but I still find it funny that MS needs to keep
repositioning their os's all the while shooting to find the middle
ground.

NT shoots too high, win95 shoots too low. Darned if I know what's
right in the middle, why it's something more the size of os/2. Just
my opinion of course. 8-)

PMJI, but just FYI, win95 makes a 8mb 486 into a really nice client.
build 490 works really well with netware; very easy to setup and use.
It's also remarkeably stable (which is as much of a surprise to me as
anyone else) as a client. Of course, it works perfectly hanging off
an NTS as well.

IMO, it just might do really well as a corporate client, given how well
I've seen it function on a LAN this week.
We'll have to wait and see how it does. I was very surprised, since I was
expecting it to be just awful...

>to large to be a workstation os. And now we see NT being repositioned
>as the corporate desktop to take up the slack for win95's shortcomings.

given how nice of a client '95 makes out of a 8mb 486 I'm sad to say that
it's possible that NTW could be deflected by win95 as a corporate client.
Again, this is just speculation; I've no idea how it will actually
turn out.

NTW still rules as a workstation os, though, no doubt about that.

>This isn't actually that bad a solution as NT is indeed more efficient

Yep. They move quickly. that's why they are such a pain in the ass for
outfits like IBM; they can respond so quickly to the demands of their
clientele. They continue to outmaneuver their duller and slower competitors.

Hello,

Sorry if this is a FAQ, but I was hoping someone could direct me to
the appropriate Newsgroup for people running MINT on a Macintosh. Please
E-mail to save bandwidth.

Thanks,

Marty

I would be surprised if there was a newsgroup, maybe a mailing list (like
the real Mint one)?

If there is one, then please post it here so that those of us who have set
up Mint on Mac's can hear about it also.

Sinclair, since you've been posting to these newsgroups you have consistantly
pissed me off. When you post "facts", you're wrong (300 3D0 games? Jag sales
figures?); when you're countered and proved to be wrong, you revert to name-
calling, and "so's your mother" arguments. I really feel sorry for the people
around you in real life who can't kill-file your worthless personality, and
I look forward to the day you decide to grow up and get a life.

Does it cost you money or cause you pain every time someone buys a Jaguar, or
what? If not, shut up. We've heard your point of view (too many times),
so unless you've got something constructive to add, don't post.

If you had even half a brain you'd be dangerous...

This is simply wishful thinking on the part of OS/2 users, and others who don't see that the major changes happening in the computer world are taking place at the consumer level. There soon won't be any place at all for any OS that does not link easily to what people want to use at home (as opposed to the other way around). The days where the systems' people dictate what people will do are fast coming to an end. NeXT might very well take note of this. It is important to get a consumer version of NEXTSTEP out as soon as possible.

Cough. Sputter. Warp wants 16MB of RAM in order to be nice to you. It does run well on a 486, though, which I don't expect Win95 to do based on using the beta.

On the Mac side of things, check out Guy Kawasaki's books "THE MACINTOSH WAY" and "THE COMPUTER CURMUDGEON". In some ways, CURMUDGEON seems to be an updated version of WAY, but both are still good reads.

Let's see...MS was THE language OEM developer in the 1970's. Almost every computer which came with a language, had a language developed by MS, for example, AppleSoft BASIC (guess what the ``Soft'' stands for). They also developed most of the languages for the CP/M machines, including Cobol, Pascal, and a few others.

Also, guess who made my 16k RAM board for my Apple][+. Guess who made my CP/M card for my Apple][. MS!

I believe, however, that MS was not the biggest software company until Windows 3.0 came out. I believe that Lotus was the biggest.

Cheers, Terry Murphy

That's a good point. Give them less and more than they want, when OS/2 is
just about right for most people who want true multitasking. Too bad people
can't see through the haze.

If you call not as stable optimized, you'll probably
like Win95. I for one like the interface enough that I'll run NT some day with
the Win95 interface (they've got to come up with a name for this thing! When
NT runs it better seems crazy to call it the Win95 interface). Neither OS is out
and Win95 has already taken it for its own. Which it is, but it's already running
on NT (even though the interface itself is beta, NT is at least on shelves.)

Again this notion that you need hardware upgrades is wrong.

: Again, home users may also choose other operating systems, with OS/2
: leading the pack. Fewer home users that already have a 486 or higher
: Windows system are going to switch to another computer, such as the Mac,
: because of the cost involved, but Apple still may be able to convert users
: currently using MS-DOS alone on older computers.

Anything is possible, but again highly unlikely.

: EDUCATION: Educational institutions are going to remain firmly planted in
: Win 3.1, because of the cost involved in upgrading all of their hardware.
sigh once more the dreaded hardware upgrade statement.

: run Win '95. In addition, and as a result, most educational software is
: going to continue to support Win 3.1, so the advantages of upgrading are
: less.

I dont see this. If developers of educational and specialist software for Windows (Im one of them) see that Win 95 is going to be a dominant OS then they will produce programs for it! In the meanwhile, Win 3.1 programs will run fine under Win 95, so whats the problem?

: INTEL P6: Based on the analysis of which OS the above market segments will
: choose, wholesale acceptance of the P6 as has happened with the Pentium is
: unlikely. Most big business, small business, home, and educational users
: are going to be using either Win '95 or Win 3.1 in the forseeable future,
: operating systems for which the P6 will outperform the Pentium by a scant
: 10%. Hardly worth the cost of upgrading to this new processor.

Sounds very familiar. When Intel manage to pump out a high speed version of the P6 (thats much faster than the P5) then people will flock to it.

: OS/2 WARP: Anyone buying a P6 is going to want a 32-bit operating system.
: While NT will likely land a good number of these upgrades, it is also
: likely that many users will want off the Microsoft upgrade treadmill and
: defect to Warp, especially if IBM eventually is able to run most Win 32
: apps.

A very big if. I remain unconvinced that IBM has the savy to push OS/2 to where it probably deserves to be.

[Stuff deleted]

The comments about how people who buy the P6 will only by a 32 bit OS are a bit silly IMHO. You could have said the same thing about a 486 or a Pentium.

[Mac statements deleted]
Nope, I will never buy a Mac. It may be easy to use, but they suck :)
(Nice objective comment there :))

: POWERPC: The folks upgrading to the P6 over the next 18 months are going
: to be power users, for the most part. They are going to have to switch
: from the Win 3.1 or Win '95 OS they are likely currently using to OS/2 or
: Win NT. They are going to have to ugprade all their apps to get the most
Why? Again you could have said the same thing about folks buying 486/Pentiums. Didnt see to many people switching to OS/2 then...

: That's it. Flame away. Even if you don't buy all of the analysis, it's
Basicly I dont buy ANY of the so-called analysis.

Altair predated the S-100 bus, though. If you assume that Altair
was the first microcomputer, then MS would have certainly been the
first microcomputer software company, since they wrote MS-Basic
before the Altair was built...it was written on an emulator which
Gates and Allen wrote on a Harvard machine before they even saw
the Altair.

Belief? That doesn't work in computers. Listen to Bill Gates and MS says.

They are all saying that Win95 is less stable than OS/2 or NT and that NT
by next year will cost the same. And they are also saying the Win95 is there
to keep people going until they get the hardware to run on NT.

Which means MS better get their hardware compatibility going for NT!

The people at IBM, led by John Backus, who developed FORTRAN might disagree
with that. So would Grace Murray Hoppers' COBOL team.
IBM was selling software while W.H. Gates III was in diapers.

The Turing Award has not been given to anyone associated with Microsoft.
The ACM must feel that computing history, and the major contributions to
the computer industry, have other people ahead of W.H. Gates III.

The computer industry was a commercial force 25 years before Microsoft
was formed.

In short, take a bottle of Ex-Lax a day, and call back in a month or so.

>memory, they should get comparable performance under Win95.
^^^^^^
The word 'should' is aptly chosen; in practice it doesn't work that way,
since Windows 95 is bigger than 3.1, which results in less free memory.
Some applications which would barely fit in some amount of memory in
Windows 3.1 won't fit now, causing the system to swap. No improvement
you give below can make a swapping system faster than a nonswapping
one.

>The disk I/O is now 32 bit, the swap file is more intelligent and also
>faster, samrtdrive is now replaced by a 32 bit cache, etc. etc.

First, the 'bitness' by itself doesn't matter that much; the advantage
of 32-bit is mostly that you don't need expensive segment register
reloads, and that it's easier to write clean code. Both of these
advantages are offset by the heavy thunking in Windows 95. Whether
a component in Windows 95 isn't that important; there are too many
components that aren't.

If there are genuine improvements in Windows 95's disk I/O, it could
be a real improvement. I doubt, however, whether that improvement is
big enough to offset the increased memory requirements. As many people
will try to install Windows 95 in memory-constrained environment, this
is very important.

>Overall Win95 is tha same or faster than even WFW3.1 let alone Windows 3.1
>itself.

You're one of the few people who comes to that conclusion. My personal
experiences are that Windows 95 is as fast as, or a little slower than
Windows 3.11. And my system has more memory (20 Mb) than most potential
Windows 95 systems.

>People *will* upgrade their memory and disk space like they always do,

They don't upgrade without a good reason. People don't think the way
like 'Hmm, I have a few bucks left, I might as well spend it on some SIMMS'
Even a hobbyist like me doesn't think so.

>The fact that there will be all those free Betas of MS Office/95 floating
>around will certainly convince people to upgrade for sure.

Hmm. Office for Windows 95 is an evolutionary upgrade, and it offers
few direct advantages to the current version, except for Windows 95's
improved reliability. You get much better reliability for less money
by running the 16-bit Office under OS/2.

Anyway, I don't see why people should get excited by the new Office.
Nothing to brag about.

Uhh...let me interject here for a second. The "evidence" you offer is only your own experience. This is called anecdotal evidence. It is fallacious to reason from your experience to the experience of users in general. *You* have had a good experience with Win95. Enjoy it. However, through MS press releases, numerous Windows magazine articles, commentary from BYTE and the Wall Street Journal, etc., etc., it can be easily concluded that your experiences with Win95 are the exception and not the rule. Are you saying that we should believe a handful of users over actual studies? I mean, most of these magazines are pro-Windows and pro-MS and they are saying these things. Have you read last month's BYTE?

As for Win3.11 apps running fine, you are wrong. Yes, they will run, but every 16-bit app has the potential of overwriting the system in the case of a crash and bringing the whole tent down with it. This is a serious mistake in the PM that MS made. Even most of the MS zealots agree with that.

> Sounds very familiar. When Intel manage to pump out a high speed version of

Look at the figures. The P5 has not enjoyed a great penetration in the market until recently, if at all. That's been over 18 months. All that

the original poster claimed was that the P6 will have similar performance.

I figure that the P6 is aimed primarily at the NT server market right now. Since Windows NT is 32 bits, the P6 is nicely optimized to run on it and should show performance gains. (and NT can certainly use all the CPU it can get)

I think Intel and to a degree Microsoft are gambling on the concept that by the time the P6 becomes a serious desktop solution, everyone will be swapping over to Windows NT for their desktop solution.

Also, while there may be a Windows 96 and Windows 97 (more likely will be bundled into a single Windows 97 just due to time delays getting 95 out the door), I think its fairly obvious that Microsoft wants everyone to migrate over to Windows NT. They hate having to live with Windows 3.1 as much as anyone, and NT has a cleaner technology base for them to work on.

Microsoft is slowly evolving towards the direction Apple and IBM are going in now. The advantage to going slowly is that if they do it slow enough, they can take nearly all of their installed base with them in the process. Rapid innovation means people get left behind to an extent that choosing another vendor isn't much harder on them than sticking with their existing vendor.

I don't think the P6 will be a flop, though it'll take longer to be a hit than the Pentium was, and will probably be tied more to the success of Windows NT than anything else.

Good discussion, everyone. I've been listening intently for new info, but I still hold by my original analysis, especially concerning the P6 and Win '95.

Despite some holdouts here in this thread, I think the majority opinion is that Win '95 is bigger than Win 3.1 and, on a 4 MB system, Win '95 is going to be slower than Win 3.1. Even if you are able to shoe-horn Win '95 into 4 MB and get reasonable performance, all the mags and even Microsoft are recommending 8 MB as the minimum, with some recommending 12 MB for good performance.

For these reasons, extremely few Win 3.1 users with 4 MB are going to buy Win '95 hoping it will run well on their existing systems. They are going to think they need 8 MB to run Win '95, and most of the Win 3.1 users out there don't have it. They may also think they need to have a bigger HD and faster processor (and they may be right).

So, will lots of people upgrade to Win '95? You betcha, at least in certain markets, but it all depends on what the perceived benefits are and their ability to upgrade the hardware that they think needs upgrading.

For education users, Win '95 is out; they don't have the money for the RAM upgrades and, as one fella pointed out, educational software makers aren't going to switch to Win 32 until Win '95 educational institutions switch to Win '95, so of course there isn't any impetus for educational institutions to switch (vicious circle).

For home users, Win '95 promises a better user interface and better ease-of-use, which all Win 3.1 users desperately want. Millions of home users will hop on the Win '95 bandwagon, even if it means upgrading the hardware.

However, chances are that the vast majority won't upgrade, for the same reason that a lot of families keep buying those $899 Packard Bell specials. They don't have a lot of free cash, computers aren't a priority, but they want their kids to have the same opportunities to play DOOM as everyone else. They didn't buy Macs or Compaqs or Dells because usability and quality are secondary, and for the same reason these folks aren't going to be investing in more RAM or Win '95 anytime soon just for a prettier UI. Just for perspective, our local Mac user group gets tons of calls from families that have just bought used Apple IIs for $50 and are looking for free software; quality and usability are secondary (maybe tertiary).

Some small businesses will upgrade to Win '95 (and the associated hardware upgrades) for the ease-of-use and the improved stability, if they have the cash. However, let's face it, a lot small businesses out there don't give a damn about ease-of-use or stability, at least that's my experience. Most of their computers are primarily used for tasks that aren't mission-critical, like word-processing, and are used by secretaries. These folks aren't going to spend a couple-hundred per computer for the necessary HW/SW upgrades for Win '95

Some people buy Windows computers because they like them, some people buy Windows computers because they need to do things only Windows/DOS can do, some people buy Windows computers because they are "standard", but a lot of people out there buy Windows computers because they are cheap. There's no way these people who bought a Windows computer because it was cheap are going to spend a couple hundred bucks just to run the same software at the same speed, nicer UI and better stability notwithstanding.

Big business is another story, but they are getting the message loud and clear these days (from Microsoft, if no one else) that Win '95 is not for them. It isn't worth upgrading all their hardware to 8 MB and their software to Win32 *yet* and when they do make that move, it will be to NT or OS/2. This doesn't mean that Win '95 wouldn't be a good system on corporate desktops; it just mean that it isn't fiscally prudent for them to do this.

So, the point is, Win '95 is going to be popular, but the analysits estimates of 10 million upgrading in the first year are probably on target, and the number is going to drop precipitously after the initial rush. People will use Win '95 because it comes on their new computers, but people who already have Windows 3.1 are not going to upgrade in droves.

This, of course, brings us to the P6. Pentium sales went through the roof not because of big business, but because of small business and especially home users who wanted to catch the multimedia wave. However, 98% of these guys are going to stay with Win 3.1 or upgrade to Win '95. Neither of these operating systems gives them any reason to buy a P6 upgrade.

Users may buy a new P6 system, but they aren't going to run Win '95 on it because P6 systems are *always* going to be more expensive than Pentium clones which will run Win '95 just as fast. Therefore, anyone buying a P6 system is going to run NT or OS/2, which means that the systems are going to come with 16 MB standard. Which, of course, means they are far out of reach of the home users and small business folks who are buying all those $2000-and-under Pentium systems.

Will home/small business users ever buy P6 systems in quantity. Probably not. These folks don't upgrade just for the hell of it; they are upgrading to the Pentiums in droves because they want multimedia to work well, which it does, so the need to speed has been temporarily sated. There will always be software that demands even more speed, but these aren't going to be mainstream apps that most people use. The Windows world is going to be stuck on the Pentium and Pentium clones for the

forseeable future, and Intel is going to lose money on the P6 (especially if the P7 debuts as scheduled in '97).

> for win95.

This is incorrect. Users of Office do require larger amounts of memory to
run all the apps in the suite properly since they have to all be open
together sometimes without undue swapping to the disk. Also, if win95 has
a "larger footprint", and 8Megs is not enough thenit would not even load
on a 4Meg machine. The "footprint" of an OS typicaly refers to the
physical space it takes up in memory, as in windows NT 3.5 "reduced it's
footprint" from the 12 Megs of 3.1 to something less than 8. You are
implying here that Windows 95 has a greater than 8meg footprint all by
itself? This is assinine. I know from personal experience, from
published tests of the OS and from the vast majority of posts (by people
who are actualy *using* the system now) that Win95 loads, and runs just as
well in 4Megs as Windows 3.1 or WFW 3.1. Not great, but just as well.
There is no *need* for users to upgrade their memory, period. You are
just wrong.

That standard is not the current standard though, it's not what developers
will be targeting their apps for NOW, is it?
>
> If you have a substandard system then you have problem. A 486 is a
> substandard system and so is 8MB. Not so under OS/2 WARP.

The vast majority of computer users, business and home would certainly
disagree with your statement that a 486 with 8Megs is a "substandard"
system. You don't seem to know anything about Win95 at all sometimes.
Hve you ever even used it? This "substandard" system is exactly what Win95
is targeted at, it actualy performs better (proportionately), on "low-end"
systems. I would beleive the accounts of people who actualy installed it
on their home systems and say how fast it runs over anything you say. No
matter how authorative you may make your posts sound, the fact is you are
wrong. This crap is just like your post about Corel draw not running on
Win95 was, ie.- a (educated) guess.

Computers.

H'mm sounds okay but Windows NT is not pltafrom specific it seems to
me that by the time the P6 is out into the mainstream there should be
more advanced versions of the power PC avialble and for the cost of a
P6 severver a dual PowerPc should be sustatually faster. This is true
even if your looking at a dual P6 configuration. Currently as far as I
know the ability of the P6 to work well in SMP is not documented while
the PowerPC seems to work quite well in and smp enviorment.

I really don't see the P6 offernig anything over a PowerPC NT severer
especially the dual SMP machines avialable today. I.e firepower.

I think the P6 is going to be more for people with legacy apps that need speed. I personally and I think a lot of people are expecting SMP to become important over the next year or so. And in this case the price per proccesor becomes important. Apple seems to even be going in the SMP direction and for Multimedia CPU intensive operations and servers this makes excellent sense. Look at SUns servers even with a dog of and OS and slow cpu they perform very well. No I think Intel better get a non legacy completly RISC chip out the dorr asap. Or they will definatly lose a large portion of the lowend workstation market and sever market to the power PC especially with a good unix and NT avialable on the PowerPC platform.

Personally I bought a Pentium because its numbers were not that different from the Power PC and my OS of choice Nextstep did not run on the Power PC now if I can get Nextstep on a dual PowerPC machine for say 700 more than a single cpu P6 machine guess which one I'm going to pick?

The "computer revolution" was well underway long before microcomputers
ever hit the market. Hell, Hollywood was making movies about it in
the 60's!

The microcomputer was *evolutionary*, not *revolutionary*; it followed
an already-established downsizing trend (one which I'd argue is still
underway).

The machines predating the microcomputer were indeed a compelling
market for software. Three lines in particular were hot: the IBM
360/370 (mainframe), the IBM System/3x (mini), and the DEC PDP series
(mini).

I can agree that the microcomputer software market is more dynamic,
and in recent years more compelling, but it's not true to say that
there wasn't a software market prior to the microcomputer.

A good bit of your support for Win 95's success seems to stem from the fact that Win95 will function in 4M RAM. I'm not going to touch that issue, but my general impression is that much of the hype around Win 95 is based on its multitasking ability. How much mulitasking will all of these new Win owners will be doing in 4M?

If many people upgrade without adding more RAM, it is clear that they will have chosen Win 95 for aesthetic reaons. And that logic, I thought, was reserved for superficial, shallow, Mac owners.

In response to being called the BIGGEST idiot Stefan has ever encountered
on the Net, I must say this...

I do NOT agree with everything Gates has done... I admire him for
achieving what he has. Do you know how much Bill is worth? 12.4 BILLION
dollars. The fact that he has made as much as he has is admirable in my
book. My post was also responding to someone looking for good books to
read. Stefan, have you read the book? I didn't think so... Go out and read
it and then judge it... Before I read the book I didn't like Gates that
much either... I now have a certain level of respect for him. I am
definetly NOT advocating that MicroSoft is great. Far from it. I was just
commenting that I liked the book. Don't ever assume things... you make an
ass out of U and ME.

>everybody knows this.

Here is where you are wrong.

Most of the performance loss in Windows with using a REAL mode disk driver
has NOTHING to do with the bitness of the code.

It has to do with switching overhead. A realmode driver needs the entire
system to be switched into real mode, executing the I/O, and then the
entire system has to be put back into protected mode.

Another point: a real mode driver cannot do overlapping I/O, nor can it
let the system do anything while it is waiting on the device to return since
most real mode drivers are NOT re-entrant.

Mode switching, single I/O ops, non-reentrant code.

SLOW.

Actually you'll find him in the very earliest microcomputer-related
magazines, since his BASIC interpreter was on the very first
microcomputer.

People have hated him since almost the very beginning since he
believed that software should be paid for rather than traded freely.
His biggest early notoriety was gained by taking out a full-page ad
complaining that people were stealing his software when they copied it
at club meetings....

...but don't let facts stand in the way of a good rant.

You're point is well taken. I should have used the word microcomputers rather than PCs. (I'm still not sure that Microsoft was actually first, but they're certainly the oldest microcomputer software company that's still around.)

:>you know, the machines that ushered in the computer revolution?

Hmm, I think I might have heard them mentioned. Can you give me some more details? :-)

:> Mainframes
:>of the 70's were not then, and are not now, a compelling or dynamic market
:>for software.

Well, 1970's-era mainframes are certainly not now a compelling or dynamic market for software. Modern mainframes, however, most definitely are. IBM (which is the world's largest software company, BTW) probably earns billions of dollars per year from mainframe software.

This is total bull and you know it, you have switched the ground of the
discussion to whether or not any particular part of Wi95 being 32 bit or
not is and "advantage" when my comment was strictly on the disk I/O and
the 32 bit cacheing systems. Both of these give a *great* boost in speed
to Win95. Try running Win95 with a "real-mode" disk access driver, (one
of the most common errors so far in people setting it up with IDE drives),
and you will get about a 50% reduction in speed. The "32 bitness" of
these areas is also one of the main reasons that WFW3.11 was faster than
Windows 3.1. Not having 32 bit I/O entails a great performance penalty,
everybody knows this.

In terms of your more general argument, there are very FEW components of
Win95 that count in issues of performance or speed that are not fully 32
bit. Virtualy the only parts that are not that affect speed are the
Windows management code, which was kept 16 bit for obvious reasons.

> You're one of the few people who comes to that conclusion.

Wrong again, try every published test in any computer magazine since the
release of the 347 Beta. Try the hundreds of posts that I have read on
MSN and here as well from "average" computer users with 4Megs that have
found their systems more responsive and 'faster" under Win95.

So are you say that they therefore must have the RAM?

>Also, if win95 has
>a "larger footprint", and 8Megs is not enough thenit would not even load
>on a 4Meg machine.

You don't understand what virtual memory is do you?

The "footprint" of an OS typicaly refers to the
>physical space it takes up in memory, as in windows NT 3.5 "reduced it's
>footprint" from the 12 Megs of 3.1 to something less than 8.

Yet are you therfore saying 8MB is sufficient for NT? Win95 has a larger
footprint that win3.1 -- try booting Win95 in 2MB.

>You are
>implying here that Windows 95 has a greater than 8meg footprint all by
>itself? This is assinine.

Did I say that? No. I said that Win95 has a lrger footprint that
Win3.1 and that MS is recommending 8MB as a minimum for Win95 and 12Mb
for MS Office under Win95.

>There is no *need* for users to upgrade their memory, period. You are
>just wrong.

you cannot explain why the trade rags predict a surge in RAM upgrades
for running win95. You have another unsupported statement.

>> Incorrect statement. The recommendations are what developers target for
>> their apps NOW. Win95 users will need NEW software and what will they
>> find? Stuff made for the p75 with 16MB of RAM.
>
>That standard is not the current standard though, it's not what developers
>will be targeting their apps for NOW, is it?

Yes it is the current standard NOW.

>The vast majority of computer users, business and home would certainly
>disagree with your statement that a 486 with 8Megs is a "substandard"
>system. You don't seem to know anything about Win95 at all sometimes.

Who cares what people think. MS has defined a NEW and current MPC
standard with a p75 as a base CPU.

I used Win95, read Andrew Schulman's book and can count version numbers.

>. This crap is just like your post about Corel draw not running on
>Win95 was, ie.- a (educated) guess.

No. It was a printed comment that MS is still trying to get Corel Draw
working under Win95. You must have misse dit this week.

>'95 into 4 MB and get reasonable performance, all the mags and even
>Microsoft are recommending 8 MB as the minimum, with some recommending 12
>MB for good performance.

When I had only run 347 in 4MB, I'd agree with you. Now that I've run
490 in 4MB, I have to disagree. Build 490 is subjectively
indistinguishable from Win3.1 or WfW in 4MB. I haven't benchmarked it,
so I have no hard numbers. The reason everyone is reccommending 8MB, is
that even Win3.1 was best in at least 8MB. You get a 50% increase in
speed out of Win3.1 by going from 4 to 8MB. I beleive MS has met their
goal of doing as well as Win3.1 in any given RAM level.

However, I don't recommend < 8MB for anything except a DOS box.
Skimping on RAM, be it NT, OS/2, or Win95 will cost you in productivity.
As processors have become faster, it is now RAM which is the limiting
factor for many uses. I personally find a 486/66 with 16MB to be a more
capable machine than a low-end Pentium in 8MB.

>For these reasons, extremely few Win 3.1 users with 4 MB are going to buy
>Win '95 hoping it will run well on their existing systems. They are going
>to think they need 8 MB to run Win '95, and most of the Win 3.1 users out
>there don't have it. They may also think they need to have a bigger HD
>and faster processor (and they may be right).

They may well need a bigger HD. Good thing you can get a 1GB drive for
$350 these days. I've seen 0.5GB for < $200. From what I can tell,
Win95 is about 10-15MB bigger than DOS/Win3.x combined, and can be more
depending on which frills you install. I have found that it is foolish
to try and install Win95 on machines with 80MB HD's - you can fit the
OS, but not much else.

Of course, I've never seen a time when I didn't want more of _something_
- I've just spent the last several days moving my data and OS's around
to accomodate the addition of another GB of storage...

>So, will lots of people upgrade to Win '95? You betcha, at least in
>certain markets, but it all depends on what the perceived benefits are and
>their ability to upgrade the hardware that they think needs upgrading.

You know that people cried that Word 2.0 and Win3.1 would suffer since
they didn't run well on 286's with 2MB...

386's with 4MB are in an equivalent position now.

[bunch of other stuff snipped...]

Actually Jeremy, while these comments weren't directed at me, from reading this thread it appears that you are the one who is misreading other people's posts. No one here has said Win '95 has an 8 MB or greater footprint; if you think otherwise, please feel free to dredge up a quote to the contrary.

What everyone has been saying is that a) Win '95 is larger than Win 3.1 and b) Win '95 is large enough that it will cause swapping on a 4 MB machine. This means that for adequate performance you need an 8 MB machine, whereas with Win 3.1 adequate performance needs 4 MB. This was my original contention, which you have disagreed with, and have been proven wrong.

BTW, on the subject of OS footprints, I don't know how big Win '95s is, but I do know that on my system Win 3.1 has a 3.5 MB footprint. In other words, if I turn off virtual memory, reboot the machine, and then check the amount of free memory in the Program Manager as soon as it comes up, it tells me I have 4.5 MB free on an 8 MB machine. I do have Win32s loaded, so that will gobble up some additional RAM I'm sure, but in all other ways it is a clean Win 3.1 installation. It wouldn't be surprising at all if Win '95 took up more than 4 MB of RAM, which obviously would require swapping on a 4 MB machine even without running any apps. Maybe some Win '95 advocates can run the same test on your machines and let us know how much is free.

Hm... I talked to an MS tech employee recently who had one thing to say
about Office95
'...believe me it will crash, it's a 1.0 release' it was almost word for
word.. and in the meantime he was rolling his eyes. This was just after
I sugested that Office95 should be more stable since it is 32bit and
right after he mentioned that Win95 'sort-of' multi-tasks.....
It was certainly a revelation.

Put it this way... businesses and users will *NOT* easily and quickly
upgrade RAM simply for one reason... the cost. In order for all our
486's to go from 8Mb to 12Mb it would cost a total of $10K. And this is
in a small office. IN any case, the cost of Win95 , Office 95 and RAM
would be too great w.r.t. the benefits. We would rather use Warp on our 8Mb
machines to run MS Office.

The Model 5100 (came out in 75) cost $9K and came with 16K of memory, 16x64 character display, DC300 cartridge tape drive, and a built-in BASIC interpreter. I don't know who's Basic it was tho. The MITS Altair was a cover story for the Jan. 75 Popular Electronics (I think the kit was ~$400).

> The microcomputer was *evolutionary*, not *revolutionary*;

Hmm.. I don't agree with that...

The microcomputer was based around the *revolutionary* development of the CPU chip, which handled all the functions of the entire computer within one IC.

The other computers mentioned, the PDP series, the IBM 360s, and the other systems of the time were built on the concept of distributed processing. There was no clearly defined central processor handling ALL functions from math computation to I/O to memory addressing.

Distributed processing was why these machines were so fast and powerful, but it was also the reason why they were so expensive and large.

Simply "downsizing" an IBM 360 would not have resulted in the same revolution in computing that the introduction of the microprocessor did.

Actually, youre all TRIPLE TRIPLE clueless. IBM, believe it or not,
tried to market the first personal computer back in 1975--years before
the IBM PC and the Charlie Chaplin commercials.

Needless to say, the personal computer computer IBM tried to sell didnt go
over too well, as the pricetag was gigantic. However, it MUST have had
software on it, obviously, which makes IBM the first company to sell
software for a microcomputer.

Bill Gates was picking his nose back in Junior High, in 1975.

(Source about the 1975 IBM personal computer: A documentary that has aired several times on PBS, called "THe Machine That Changed The World", I believe it's called)

>
>You don't understand what virtual memory is do you?

As usual you manage to interpret what I say in what can only be described as
"unique" fashion. It would be very unusual to load the OS itself in virtual
memory would it not? I mean if you can't even load the entire OS code into
memory without swapping to disk there isn't much point is there? YOu directly
implied by your previous post that Win95 had a larger than 8Meg "footprint"
and would not therefore load in less than 8 Megs. This is not true.
>
> The "footprint" of an OS typicaly refers to the
>>physical space it takes up in memory, as in windows NT 3.5 "reduced it's
>>footprint" from the 12 Megs of 3.1 to something less than 8.
>
>Yet are you therfore saying 8MB is sufficient for NT? Win95 has a larger
>footprint that win3.1 -- try booting Win95 in 2MB.

The connection between these three statements escapes me. Am I talking to a
random phrase generating program? 8 Megs is sufficient to load NT just like
2Megs is enough to load Win3.1, useability is another issue. I have loaded
both of these myself in these memory configurations so don't tell me it can't
be done. They are both the recommended minimum for each OS. NT can actualy
be loaded in 5 Megs. As for Win95 having a larger footprint, this could be
true, I don't htink I've ever said otherwise.
>
>>You are
>>implying here that Windows 95 has a greater than 8meg footprint all by

>for MS Office under Win95.

This is false. In the first place you directly implied in your post that
Win95 had an 8 Meg footprint, but maybe that was just poor phrasing on your
part. In the second place, MS says that Win95 will run in 4 Megs, which is
the recomended minimum, they also further recommend 8 Megs for better
performance.
>
>>There is no *need* for users to upgrade their memory, period. You are
>>just wrong.
>
>you cannot explain why the trade rags predict a surge in RAM upgrades
>for running win95. You have another unsupported statement.

You are mixing the issues again - changing the basis of what we are supposedly
debating. Whether or not people will buy memory, or think they have to, or
are told to, or are predicted to, has no bearing on the factual argument of
whether or not Win95 runs as good or better than Win3.1 in the same memory. My
experience, the experience of others that have run Win95, and every test I
have seen of Win95 vs Win3.1 in any magazine since the final beta came out
confirms what MS has been saying which is that you will get the saem
performance in the same memory as Win3.1 with Win95. I don't know why you
don't get this, since this is about the fourth return on the same thread and
it is restated at least twice in every post.
>

> disks without having an ST?

Hmm.. the early Spectre 256 didn't read or write Mac disks directly, so it used its own disk format to simulate the Mac filestructure on an Atari floppy drive.

If the PC can't read the disks directly (when not emulating the Mac), I don't know if there's any way a conversion can be done without an ST.

I don't have Dave Small's current e-mail address, but if anyone on the planet could tell you if this is possible, he'd be the one who can.

I think it was IBM's own BASIC. Note that there were two variants on
the machine; the other had, if I remember right, APL rather than
BASIC.

I missed the 5100, but IBM's second PC attempt was the System/23
Datamaster (1979?), 128K (in 2 64K banks), spoke EBCDIC, and had a
built-in BASIC that very closely resembled FORTRAN in its I/O
capabilities. It had a built-in screen, an integrated keyboard that
was virtually identical to the IBM PC, 2 integrated 8" floppies (the
loudest I've ever dealt with!) and a printer. My "favorite" feature
was the way it gave all its errors as numbers that you got to look up
in an error manual.

He could have made a zillion dollars and it wouldn't make a difference. Bill gates is an evil man. And I say that most seriously. I'm not talking about his personality or his lack of
personal technical skill et. al. (I myself would be convicted on those two counts :) He is evil precisly in the way he applies his business genius.

Ponder this. Steve Jobs and about 100 other people are responsible for designing a computer (which in many people's opinion is still THE BEST hardware ever made), the NeXT, and operating system which is arguably the BEST, technically speaking from scratch. He's managed to port this OS to 3 other systems and counting.

In this time Windows has moved from 2.0 to 3.1. Now Gates can afford and does have more in quantity and perhaps in quality of personell, yet he releases the kind of dribble that he does. Why? Because it is profitable to get a zillion upgrades from us, and never give us what we really deserve. He also drives competitors out of business the way the automakers drove out Tucker and his inovations.

Now I learned a big lesson from the big three smothering ingenuity. And that lesson is that the rest of the world will not slow down, and now I drive a Japaneese car because the US companies lost there ability to compete by there "gentlemen's slowdown."

Bill gates is stiffling the US software industry in the exact same way. India, Russia and other countries will not be slowed down. And one day we will be using software from IndiaSoft. Don't think it can happen. Think again, think Honda. Bill gates is evil because he will cost this country big time, all for his own evil personal gain.

Microsoft with its resources and size, given what a hundred or so people at NeXT can do, should have given us an OS that can read our minds. Gates purposely is slowing down the industry. He is quite simply, a bad person, because he's smart enough to know what his actions will and are doing to this country.

Thanks Bob
I managed to solve my own problem. Found a program called Macsee that
did the transfers. Unfortunately I've discovered that most of the disks
are in SS MFS format from the old Magic Sac days. MacSee wont read these
at all, tho' it handles the 2S HFS Spectre disks just fine.

I am sorry to tell you this, but most of the people I know who use windows 3.11 in 4 megs would not pay the money to upgrade to WIN 95. Most people who do any type of serious work in windows use at least 8Megs. Windows is slow and slugish in 4Megs and does not run any productive software well in 4 MB (ex WordPerfect 6.1 or Word) . Must of the beta testers I know for 95 have between 8 and 32 MB of ram. Why did they spend the money on ram because they wanted to increase speed and performance of the OS. Who will spend money on a bleedind edge OS? People who are looking for speed and pefromance improvements.

: Hmmm... that's still more than **THREE TIMES** as many for the 3DO system..

Very true. I was just extremely sick of people the Sinclap making
things seem much worse than they are. 55 games more than the Jaguar seems
more acceptable than 245 more games, don't you think?

: And both systems have been on the market almost exactly the same amount
: of time.

Yes, though the 3DO has been in *MASS* market for longer and the
developers systems were out there sooner.

: Is that supposed to make Jaguar owners feel better..?

No, but it is making a point that Sinclap is really overdoing things.

>discussion to whether or not any particular part of Wi95 being 32 bit or
>not is and "advantage" when my comment was strictly on the disk I/O and
>the 32 bit cacheing systems.

You emphasized very much on the I/O and cache system being 32-bit. I
merely considered it a good idea to make clear that the 'bitness'
itself is not *that* important. Improvements are nice, but the cache
being 32-bit is not really that important, and faster disk I/O has to
measure up against other things that are slow (though not necessarily
slower than Windows 3.1)

>Both of these give a *great* boost in speed to Win95.

A boost? Yes. A *great* boost? Not at all. You're still stuck with FAT,
which is one of the major reasons why DOS disk I/O is so slow.

>Try running Win95 with a "real-mode" disk access driver, (one
>of the most common errors so far in people setting it up with IDE drives),
>and you will get about a 50% reduction in speed. The "32 bitness" of
>these areas is also one of the main reasons that WFW3.11 was faster than
>Windows 3.1. Not having 32 bit I/O entails a great performance penalty,
>everybody knows this.

The reason for the Windows 3.11 speed boost was not in the disk I/O being
32-bit, it was in because the necessity to thunk down was eliminated.
Thunks are slow, very slow, we have seen that with OS/2 2.0, and it's
also one of the reasons why I'm less than excited about Windows 95's
speed.

>In terms of your more general argument, there are very FEW components of
>Win95 that count in issues of performance or speed that are not fully 32

>bit. Virtualy the only parts that are not that affect speed are the
>Windows management code, which was kept 16 bit for obvious reasons.

Almost the whole GDI is 16-bit too, this could well be a problem with
graphics-intensive apps. But as I said, the biggest speed problems do
not lie in the 16-bit parts by themselves, even though you like to make
it appear that way, but in the *thunking*. A 100% 16-bit OS is slow
because of the costly segment switches. A 16/32 bit hybrid (like
Windows 95 and OS/2 2.0) is slow because the speed boost of the 32-bit
parts is offset by the slowness of the thunking.

>> >Overall Win95 is tha same or faster than even WFW3.1 let alone Windows 3.1
>> >itself.

>> You're one of the few people who comes to that conclusion.

>Wrong again, try every published test in any computer magazine since the
>release of the 347 Beta. Try the hundreds of posts that I have read on
>MSN and here as well from "average" computer users with 4Megs that have
>found their systems more responsive and 'faster" under Win95.

'More responsive' might be due to better multitasking. (Windows 95's
multitasking is awful, but anything is better than Windows 3.1) 'Faster'
could well be a self-fulfilling prophecy. If you use a stopwatch, hardly
anything in Windows 95 is faster - except disk I/O. My point was, and is,
that Windows 95 will have to run on systems with too little memory, and
that better disk I/O cannot offset the disadvantage of a larger footprint.
On systems with little memory, larger memory requirements immediately
mean a *big* loss of speed, and you know that.

>You probably did not set it up right, why don't you post your autoexec.bat
>and config.sys so we can see what you did wrong?

This comes from the same people who complain about OS/2's tons of options
and switches and say Windows 95 and NT are easier.. at least you admit
tweaking is necessary. I wonder if the computer illiterate people for
whom Windows 95 is intended will do that.

BTW, I deleted my Windows 95 configuration files along with the rest
of Windows 95 when I was done testing. I have real work to do, you see.

>> >People *will* upgrade their memory and disk space like they always do,

>> They don't upgrade without a good reason. People don't think the way
>> like 'Hmm, I have a few bucks left, I might as well spend it on some SIMMS'
>> Even a hobbyist like me doesn't think so.

>Cheap shot, that's not what I meant (which should be obvious if you put
>the context of the statement back)

You said 'people will upgrade their memory and disk space like they
always do.' *Do* they always upgrade their memory and disk space? No,
they only do that when they have a 'good' reason, and there aren't
that many good reasons. You went off from a wrong assumption, namely

that people often upgrade. People (generally) only upgrade their hardware when that's necessary for something they'd like to run - and that might be the case with Windows 95 (though I'm not sure of that, and this factor may limit Windows 95's proliferation). In that case, Windows 95 is not the 'excuse' but the reason itself.

>WRONG. (again) You have never seen Office for 95 have you? It is quite a
>bit different, much more stable, and more reliable than Office under OS/2
>could ever be.

I have seen a beta (briefly). I haven't been able to look at it long enough to say something about the stability and reliability, but they will (should) be more a testimony to the greater stability in Windows 95 (as compared to Windows 3.1!) than to code changes in Office itself.

Featurewise I haven't been able to find any big changes, except for Word's new help system. In short, any change in feel is probably due to the new platform and not to the app itself.

>Don't think it can happen. Think again, think Honda.

Computer software and operating systems do not have the same dynamics of
the auto industry. A good cheap car is immediately usable by anyone in any
country. An OS must have software to support it. Next could give NS
away for free and it still would have minuscule market penetration (e.g.
Linux). Give away cars for free??? Yeah, I'd bite, but it ain't happening.

>--
>Later, John

Software innovation proceeds apace in this country, as it does in the
rest of the world. In fact, having an established standard of
programming makes it easier to write a better-mousetrap program and know
that 50 million folks will be able to use it if wanted. Why is there
Delphi for Windows, and not for OS/2, Unix or Linux???

I am no big fan of Bill Gates or MS, but this idea that other countries will outpace us due to his stifling influence is without merit. Probably the country with the greatest per capita software innovation is Israel. Yet you don't see Israeli software overrunning US markets.

Actually, it *is* evolutionary, in a sense -- the computer
business has been shrinking its electronic switches ever since the 1950's
-- and has been going to greater and greater component densities.

The first computers to use electronics used vacuum tubes

Then in the 1950's, transistors appeared. Good riddance to
glassfets :-)

In the late 1960's, integrated circuits appeared. The first ones
could hold only 20 or so transistors or so, but later and later
generations could hold more and more transistors.

CPU's on chips started appearing in the early 1970's, even though
they were very dinky by present-day standards. But later and later
generations have been getting faster and faster and more and more capable.

So it *has* been evolutionary, in a since.

And compare some mid-1970's micro with a present-day one. Most
present-day desktop-sized computers can outperform most mid-1970's
mainframes in *everything* with the possible exception of I/O throughput.

| Hmm.. I don't agree with that...

| The microcomputer was based around the *revolutionary* development of the
| CPU chip, which handled all the functions of the entire computer within
| one IC.

Faulty logic; revolutionary part does not equal revolutionary whole.
:)

Take, for instance, the bicycle. The change from wooden wheels to wooden, banded wheels to rubber wheels is -revolutionary- in the last stage. However, it's still a bicycle; a revolutionary change in the wheel, an evolutionary change in the whole.

The microcomputer and the earlier computer systems used the same premises; they were not revolutionary in thought, only in the implementation of the part. The change from tubes to solid state was revolutionary in the existence of the tube; however, the television made an evolutionary change; it did not suddenly become something completely different. Neither did the computer make that revolutionary leap.

Besides, this evolutionary/revolutionary is easily fought by drawing the lines differently. If one draws them carefully enough, nothing is ever revolutionary; only the continuation of a previous trend. In that situation, revolution in thought only takes place under situations of pure discovery, such as the apple on the head trick that only one person in history has managed to acutally get the mystical cause and effect that changed the minds of so many after it. Most people just get a bruise.

| Simply "downsizing" an IBM 360 would not have resulted in the same
| revolution in computing that the introduction of the microprocessor did.

Revolution in "computing" != revolution in "computers". The popularization of the computer did not create a revolution in the computer itself, only in society's thought. An evolutionary change in the computer could be just as responsible. You've got this nasty little habit of trying to take effects and make them the cause, and everyone knows that things like that only work if you put out a CD for people who watch too much Nova, and then use that CD to come up with

the underlying workings of the Universe, dubbing it "Special
Relativity", and using the money to buy yourself a better calculator.

Well, from what I had read of _Hard_Drive_, Microsloth had actually
gotten it from Tom Paterson who then worked for Seattle Computer. What
Paterson had done was look at the documentation of CP/M and wrote his
operating system for it. Kildall had even called him saying he ripped
it off because much of the code for QDOS looked much like CP/M's.
Microsloth, knowing they had the deal with IBM, did what they could to
buy the OS from Seattle Computer (and in return giving them updates to
the OS and liscensing of it.)

> but it was also the reason why they were so expensive and large.

Alright, then what do you have to say about the Amiga? It came out in 1984 or '85 (don't remember which) and it had the "distrubted processing" concept with its specialized graphics chips and I think even sound chips too. (Please correct me if I'm wrong on that.) It wasn't "big" and "expensive" (I'm looking at an original A1000 now, got signatures underneath the "hood" too!) And from what I understand, it was the least expensive computer on the market at that time.

Too bad PC's stayed with the sucky x86 processor. Amiga had a great idea with their hardware.

Bill Gates is an evil man because of Bob. (:

But seriously, Bob was SO condescending. (I bet Microsloth tells the
total newcomer to PEECEEs that this is an OS too.) It was geared toward
the new user. As a new user, *I* would be insulted by the way it
down-talked to me. Also, how can you produce such an asinine piece of
software that requires SO MUCH in hardware resources?? That is EVIL
too. Evil in that it left out ALOT of people who want a computer, but

can't aford one because they don't have the hardware to run it. (I feel the same about Win9x too.)

Evil is also shutting out those who wish to participate, but, because of lack of funds, aren't able to. I have found that most people who couldn't afford a PEECEE went Amiga, and they turned out with a better machine to boot. (Macs - I don't know WHAT their problem is, or WHERE they are coming from with THEIR pricing...)

I didn't say pricing was *the* issue, either. I mentioned usability and software support.

>If anything I was talking about functionality and innovation and
>why I e.g.'d Tucker. Sooner or later an OS will come out that
>will in metaphorically 'read our minds' or in some other sense be so
>advanced as to push people away from their apathetic acceptance of
>Microsoft's products to perhaps a foreign software maker.

It could happen, but for now it is pure conjecture. Advanced features do not in themselves sell software. Remember Lotus Improv?? It was in many ways a revolutionary piece of software. What happened to it? One problem was that it came out for the NeXT, and companies were largely invest in what might amount to a $8000 (?) dongle for a cool piece of software with unknown applicability. Finally Lotus got smart and released it for Windows, but by then Borland and others were already incorporating pieces of Improv-like technology in their own spreadsheets. Now Improv doesn't exist anymore.

So even *if* Mindreader for IndiaSoft comes out, what is to stop a Windows version from being released? Unlike IBM, MS has shown no reluctance in creating whatever APIs it takes to latch on to the next available technology. Remember the Pen Extensions for Windows?? That kind of fell by the wayside, but it can always be revived if or when the pen paradigm becomes viable in a big way.

Yes this is happening, but *nothing* that we do can stop other countries
from having a larger rate of increase, if they are starting from a low base.
That doesn't mean, however, that we can't maintain a lead indefinitely.
(I'm not saying that will happen.)

>Not to mention those countries, especially
>Japan, have special government agencies that pour tons of government
>resources into improving software development. Check out japan, they have
>ministry or department of software, and they feel like they cannot
>penetrate our market and are killing themselves to figure out how to crack
>our software market.

MITI's efforts in this area have been a failure. What
happened to the Fifth Generation Computer project? They were already
supposed to have a "thinking" computer. Their non-alphabetic needs were
supposed to translate into a huge success in releasing pen
computers...hasn't happened, although they have, admittedly had success
in certain specific areas, such as LCD screens and RAM chips.

Still, even their hardware successes have been limited. Just ask NEC,
which has tried in vain to be a player in the US PC market.

>(this of course doesn't pertain to the software
gaming market, which in all practicality, they own). How long do you
think it will take japan with the zillions of dollars and other huge
resources to concur us on this front?

Japan is a very rich nation. But throwing millions of dollars at a problem
does not automatically lead to dominance. Just ask Sony, with the
stillborn MD. What happened to the data MD, anyway? By the time it gets
general release, *American* companies like Iomega will have rendered it
obsolete.

>> I am no big fan of Bill Gates or MS, but this idea that other

>Lets see, from tucker to say 1985 when the japanese had really
>become established, that is say roughly 50 years. So tomorrow Israel
>wont take over, but what about 2045.

2045 is a long way away. Notice, I never said that other countries won't overtake us in the long run. In the *very* long run, it is probably inevitable--no nation stays on top forever. What I am saying is that when this happens, it won't be due to the Evil Mr. Gates. It'll be due to a zillion other things...low American education levels, increasing capital investment in Eastern markets, the decreasing attractiveness of the US as an immigration ("brain drain") destination....

Bill Gates has *helped* the US dominate foreign markets. His operating system crushed MSX, crushed independent European OS developments, and if or when, the torch is eventually passed to India or China, it will be more likely due to cheap labor than to greedy software magnate.

>I tend to worry about the future and what kind of opportunities my kids

>twice. We don't have many more industries to give away.

So long as you are making sure your children are properly educated, you shouldn't have to worry about their future. As the US has become less dominant, the wealthy and educated have not suffered, it is those of us without marketable skills that are left without opportunities. Not GMs fault, not MS's fault, not anybody's "fault", really. If anything, you can blame it on the successes of capitalism.

>Bad analogy. I'd use NS if it was free.

You would?? I seem to remember a while back they were "practically"
giving it away to students for $99. Not sure about that, maybe $199?
Really, that is an insignificant cost compared to the price for a PC and
for the software you would need to run your business. Even NTW at $299
is "cheap" if you are planning on buying $1000 of NTW apps that you need
to make a living.

Yes they have some very "nice" software, just like NeXTStep is "nice."
But, oddly enough, what people think is nice and what they are willing to
pay for to run their businesses are often two different things. Do you
know anybody who is a programmer who doesn't think Windows 3.1 sucks?

>As for free software, a la linux, how do you think M$ got so prevelant?
>In the early days people were giving Windoze to each other left and
>right. Did M$ complain too loudly? Nah.

Yeah they complained very loudly! Bill Gates has complained his entire
life in the software industry about pirating.

And I find it hilarious when
>M$ quotes it's unrealistic installed base. I personally have 7 copies of
>windoze collecting dust. Did I want them? Hell no, but I got them
>anyway. Why? Because they came with the computers. Do I use any of
>them. No. Now, I know that I'm not the only person in this situation,
>but does anyone take this into account? Nah, it's not as impressive for
>the marketing hags.

The copies sitting collecting dust and the pirated copies cancel each
other out.;-)

Seriously though, nobody could give a rat's ass whether there are 70
million Windows users or 7 million. It's the amount of software they
purchase that determines what the marketing hags will eventually produce.
There are far more DOS licenses out there than Windows licenses. Guess
which platform has more packages produced for it, and why?

Remember WP for the Amiga?

>away for free and it still would have minuscule market penetration (e.g.
>Linux). Give away cars for free??? Yeah, I'd bite, but it ain't happening.

Bad analogy. I'd use NS if it was free. From everything I've heard it's
pretty nice. But for the prices they try to get for it? It's highway
roberry. The only people that can really afford to have any kind of
installations are educational institution. Now, why do you think people
aren't developing apps for NS? It's all a matter of "market penetration"
ie, catering to the lowest common denominator.

>Software innovation proceeds apace in this country, as it does in the
>rest of the world. In fact, having an established standard of
>programming makes it easier to write a better-mousetrap program and know
>that 50 million folks will be able to use it if wanted. Why is there
>Delphi for Windows, and not for OS/2, Unix or Linux???

Because Borland has to cater to windoze users just as much as any other
large software company. Other platforms come later.

>I am no big fan of Bill Gates or MS, but this idea that other countries
>will outpace us due to his stifling influence is without merit. Probably
>the country with the greatest per capita software innovation is Israel.
>Yet you don't see Israeli software overrunning US markets.

Where is OS/2 doing well? Overseas. People hate Bill Gate$ and M$
overseas. As for seeing a lot of competion from Isreal, believe it. I
have seen several very nice packages coming out of Isreal. Packages that
put some of the stuff floating around places like CompUSA and Egghead to
shame.

As for free software, a la linux, how do you think M$ got so prevelant?
In the early days people were giving Windoze to each other left and
right. Did M$ complain too loudly? Nah. And I find it hilarious when
M$ quotes it's unrealistic installed base. I personally have 7 copies of
windoze collecting dust. Did I want them? Hell no, but I got them
anyway. Why? Because they came with the computers. Do I use any of
them. No. Now, I know that I'm not the only person in this situation,
but does anyone take this into account? Nah, it's not as impressive for
the marketing hags.

Matt

I think that is the problem the original poster is pointing out.

"If or when the pen paradigm becomes viable in a big way", then
Microsoft will latch on to it, supposedly.

Who is the mysterious somebody or something that will make the pen
paradigm viable in the first place ? You've already conceded that
it won't be Microsoft.

: Still 300 titles..

Jesus Christ Peter, I'm beginning to think that the snail I saw
on my driveway is more intelligent than you! Haven't we gone over this
TIME and *TIME again!

: So..Does the market care. Still only less than 30 titles available.

Peter, if the Jaguar dies, the 3DO won't be far behind it. It's
not doing well either.

: > : Is that supposed to make Jaguar owners feel better..?
: >
: > No, but it is making a point that Sinclap is really overdoing things.
: >

: In what way. I have been right on the predictions. A no brainer in Atari's
: case.

You predicted Atari would be bankrupt. They aren't. You predicted
Atari would have no developers. They do. You have been overdoing things
on that 300 titles vs. 27 titles bit for a long time.

>Windows. Ok, I'm convinced, I'm glad I can stop worrying now.

Hey, you provided examples, "Tucker and auto industry", I'm providing
counter-examples. Be fair.

>> Yes this is happening, but *nothing* that we do can stop other countries from having a
>larger rate of increase, if they are starting from a low base. That doesn't mean, however,
>that we can't maintain a lead indefinitely. (I'm not saying that will happen.)

>Yes, there is, we can prevent companies like MS from purposely slowing our rate of
>technological progress by not allowing them to practice anti-competitive, monopolistic
>business. And is precisely why Bill Gates is an evil person.

No, this will not stop foreign competitors from having a larger rate of increase. If Sri Lanka goes from producing fifty software products a year to a hundred and fifty, they have tripled their output. No power on Earth is going to make the US triple its output in a year. (I should note, for those who are wincing at this example, that it is John who brought up _rate_ of increase as if it were a determining issue. And my apologies for making up wholly fictitious Sri Lankan figures.)

>Wow, did you know how many times japan failed in initially getting into the US car market.
>People used to appropriately laugh at the cars they produced. It may take time, but I
>would not recommend underestimating a japanese effort at doing anything.

Don't overestimate it either. Japan is not some Super Powerful All-Invincible Force. Such thoughts only unreasonably add to Japan/US tensions. You are right in noting that they are a very powerful and formidable competitor. But their time in the sun will pass too, eventually... (Maybe you are unaware that Japan continues to be in a painful recession. Painful from the Japanese standard, that is.)

>> Still, even their hardware successes have been limited. Just ask NEC, which has tried
>in vain to be a player in the US PC market.

>Ditto to above.

I am bringing up examples, you are bringing up Japan, Inc. A bogeyman.

>> Japan is a very rich nation. But throwing millions of dollars at a problem does not
>automatically lead to dominance. Just ask Sony, with the stillborn MD. What happened
>to the data MD, anyway? By the time it gets general release, *American* companies like

>The japanese rarely, and simply throw money to solve a problem.
>They are smart and
>eventually will succeed at whatever they try.

Being smart and racking up an impressive list of past accomplishments does not mean that you will eventually succeed at everything. Look at the U.S.

And why do you think that anticompetitive practices are bad in the US but good strategy when the Japanese do it?

>Especially if we do nothing about it by
>letting Bill Gates depress our competitiveness. The fact
>that the may fail at a project or
>two shows at least they have the balls to try new innovating ideas.
>Something that we

>used to be known for.

We still are known for it, in the software industry. And in case you
didn't notice, our automakers have not rolled over and played dead yet,
either.

>> 2045 is a long way away. Notice, I never said that other countries won't overtake us in

>Yes, there is, we can prevent companies like MS from purposely slowing
>our rate of technological progress by not allowing them to practice
>anti-competitive, monopolistic business. And is precisely why Bill
>Gates is an evil person.

I doubt Bill Gates is slowing much of anything down in the hardware market, which is where the Japanese will probably be the most serious threat. In the software industry, different rules apply, and Japanese companies would have the same problems that US companies have in going up against Bill and company.

Actually, I could make a case for Bill pushing the industry forward. His software products consume so much RAM and CPU time that the chip producers keep having to advance their technology to make his stuff run at a decent speed.

>Wow, did you know how many times japan failed in initially getting
>into the US car market. People used to appropriately laugh at the cars
>they produced. It may take time, but I would not recommend
>underestimating a japanese effort at doing anything.

The Japanese are not the invincible gods that the press makes them out to be. And their strength is more in hardware than software. Even there, they tend to do better in some areas than other areas. RAM they are incredibly good at, but you'll notice that they haven't made that big an impact in CPU design.

>The japanese rarely, and simply throw money to solve a problem. They
>are smart and eventually will succeed at whatever they try.
>Especially if we do nothing about it by letting Bill Gates depress our
>competitiveness. The fact that the may fail at a project or two shows
>at least they have the balls to try new innovating ideas. Something
>that we used to be known for.

Bill Gates is strangling the software industry. The hardware industry is just as cutthroat as ever. And while the Japanese are very good at being competitive, in the PC clone industry its hard to make things any more competitive than they already are. Bear in mind we're already having cheap clone makers from Asia in the market. These countries are already a big threat to the Japanese.

I don't think the Japanese are going to be a serious threat in the software industry anytime soon. India, on the other hand, that is a

threat I take more seriously. They're turning into a serious software powerhouse over there, and given the resources with which they're doing it, I am impressed.

>Of course it won't be SOLELY due to Gates, but he is a LARGE factor.
>And I simply will not believe that because no other country has stayed
>on top, we might as well give up the fight. If I become #2 at
>anything, it will be against my will to say the least. I think it's a
>pretty lame mentality to say, oh well, we can't be number one forever,
>lets go eat some pie. However, you are absolutely correct in pointing
>out there are a multitude of factors contributing to decreasing
>competitiveness.

Bill Gates does threaten to strangle us software-wise. However I don't think it will happen. Software is a much more nebulous quantity than hardware, and its easier to slip from the top. I think this is some of the reason Microsoft struggles even harder these days to keep their top position. Once they slide down, its going to be very hard for them to get back to the top.

>No, it won't be cheap labor, it will be more innovative products.
>The price of selling software to a mass market is less based on labor
>(probably not at all), but rather on potential mass market share.
>This, of course doesn't hold to MCCA type software design.

The price of software is heavily determined by labor. Software is the industry where the manufacturing costs of the product are low on the list of things to worry about. Writing the software in the first place is a major hurdle, and promoting the software and supporting it are also money sinks. Manufacturing is more trivial. A CD costs a buck to stamp out, and manuals aren't that expensive to produce in bulk. (well, not cheap, but compared to the other costs involved its not the biggest worry)

>Anyway, on an innovation level, you really need a well educated
>designer/developer to get you innovative new products that make you
>more competitive. And Gates may quash innovation in the states, but
>he can't quash every foreign government or industry. Foreigners will
>be free to innovate.

On the bright side, Gates can only stifle the industry so long as he stays on top. Once he slips his grip on the industry, I'm fairly certain things will balloon back. That might be due to foreign countries producing hot software and then taking it over to the US. Bear in mind, we're one of the more computerized nations around, we're a hot market.

The next big question is whether after Bill loses control can any one software company dominate the industry the way Bill did. I don't think so. Once he goes, that frees up domestic software companies to go back into production. And in the software industry, there is still an advantage to being domestic. (support is easier, designing the

software to the peculiarrites of the local culture, marketing)

>There are lot of educated people in the US that lost their jobs to
>foreigners. A LOT of jobs, not just the assembly line jobs, went
>overseas with the auto industry that we lost. The auto industry was
>and is THE LARGEST industry, and probably will remain so until
>telecommunications surpasses it, about in the year 2000.

The thing is, in the software industry, the job size to marketshare size is a lot more nebulous. You can dominate the industry in a particular niche without being particularly huge.

The real trick is in defining the standards, and the inudstry is heading towards and open standard style of working. Bill is fighting this, but I think its a matter of time before he loses. You define a standard, convince everyone to use it by forming a consortium to define the standard.

Bill and his company come from a closed, proprietary style of standard development, and I think he's one of the last big ones to finally fall. After that, I don't think any one company will be able to hold a grip on the industry and while many software companies are being somewhat stifled now, I think they'll have a fast recovery time. If the old companies don't bounce back, new ones will form.

I think a predecessor of WORD-11 was available then, although on an etc.,
not ported to VAX until there were VAX. The descendants of some
contemporaneous business apps are still running. I was making them
VAX/pdp compatible in the early '80s.

>implied by your previous post that Win95 had a larger than 8Meg "footprint"
>and would not therefore load in less than 8 Megs. This is not true.

I only said WIN95 had a larger foot print than Win3.1. Your smartypants reply
was that:
BEGIN QUOTE
>>>Also, if win95 has
>>>a "larger footprint", and 8Megs is not enough thenit would not even load
>>>on a 4Meg machine.
END QUOTE

Win95 has virtual memory so your logical argument about a 12MB
recommendation for OFFICE implies that it would not load in 4MB is
flawed to the core. 4MB systems will swap and use > 4MB of logical
memory in a 4MB physical meory space.

>> The "footprint" of an OS typicaly refers to the
>>>physical space it takes up in memory, as in windows NT 3.5 "reduced it's
>>>footprint" from the 12 Megs of 3.1 to something less than 8.
>>
>>Yet are you therfore saying 8MB is sufficient for NT? Win95 has a larger
>>footprint that win3.1 -- try booting Win95 in 2MB.

>The connection between these three statements escapes me.

No doubt.

The minimum amount of RAM to boot and run win3.1 is 2MB. Win95 will
not boot in 2MB so Win95 has a larger footprint. I'm right.

>Am I talking to a
>random phrase generating program?

Your talking to PhD with MS in CS.

>8 Megs is sufficient to load NT just like
>2Megs is enough to load Win3.1, useability is another issue.

It's the same issue. We are taking about footprints of the OS's.

>I have loaded
>both of these myself in these memory configurations so don't tell me it can't
>be done.

Not did I NOT say it cannot be done. I explicitly said it can be done.

>They are both the recommended minimum for each OS. NT can actualy
>be loaded in 5 Megs. As for Win95 having a larger footprint, this could be
>true, I don't htink I've ever said otherwise.

>>Did I say that? No. I said that Win95 has a lrger footprint that
>>Win3.1 and that MS is recommending 8MB as a minimum for Win95 and 12Mb
>>for MS Office under Win95.
>
>This is false. In the first place you directly implied in your post that
>Win95 had an 8 Meg footprint, but maybe that was just poor phrasing on your
>part.

No the problem is your poor ability to comprehend simple sentence
structure. I never implied that WIN95 has a 8MB footprint. I said MS
recommends 8Mb and that Win95 has a larger footprint than Win3.1.

>In the second place, MS says that Win95 will run in 4 Megs, which is
>the recomended minimum, they also further recommend 8 Megs for better
>performance.

MS recommends 8Mb for win95 and 12Mb for OFFICE95 -- keep up with them.

>>>There is no *need* for users to upgrade their memory, period. You are
>>>just wrong.
>>
>>you cannot explain why the trade rags predict a surge in RAM upgrades
>>for running win95. You have another unsupported statement.
>
>You are mixing the issues again - changing the basis of what we are supposedly
>debating.

No I just told you that your assertion that there is NO NEED to UPGRADE memory
is false.

>Whether or not people will buy memory, or think they have to, or
>are told to, or are predicted to, has no bearing on the factual argument of
>whether or not Win95 runs as good or better than Win3.1 in the same memory.

Benchmarks show WIN95 needs much more than 4MB - 8MB is a recommended
minimum. ISM's are aware of the additonal RAM amounts needed and
stories are written about the problem.

>My
>experience, the experience of others that have run Win95, and every test I
>have seen of Win95 vs Win3.1 in any magazine since the final beta came out
>confirms what MS has been saying which is that you will get the saem
>performance in the same memory as Win3.1 with Win95.

Word does not run as fast under Win95. You make a false claim that MS
had backed off on making now that the facts are out.

>I don't know why you
>don't get this, since this is about the fourth return on the same thread and
>it is restated at least twice in every post.

I don't care how often you claim to post inaccurate information. Its
still inaccurate each time you assert it to be fact.
....
>>>That standard is not the current standard though, it's not what developers
>>>will be targeting their apps for NOW, is it?
>>
>>Yes it is the current standard NOW.
>>
>>>The vast majority of computer users, business and home would certainly
>>>disagree with your statement that a 486 with 8Megs is a "substandard"
>>>system. You don't seem to know anything about Win95 at all sometimes.
>>
>>Who cares what people think.
>
>Obviously you only care about your own opinions.

FACT: MS pick a P5-75. That's not my opinion. You the one passing
unfounded opinions as fact.

MS picked a P5-75 as the base CPU for the PCM 3.0. What you say and
what you claim others say is irrelevant. The specifications MS has set
are not debatable. I am not pompous for sticking to the facts.
You are for thining your verbose denials carry any meaning.

>>MS has defined a NEW and current MPC
>>standard with a p75 as a base CPU.
>>
>Where was this published? It certainly hasn't come with any of my MSDN stuff
>over the last year and a half.

Then what you you claim the standard is?

>>No. It was a printed comment that MS is still trying to get Corel Draw
>>working under Win95. You must have misse dit this week.
>
>I did not miss the immediate response of about four or five people telling you
>how wrong you were. You just regurgitate what you read, interpreted through
>the unusual lens of Joseph Coughlan.

I do not say COREL DRAW did not load. I said MS claimed COREL DRAW did
not work properly -- I'm not MicroSoft nor am I interpreting anything.

What makes you think that anyone of those folks did any testing at
all? You are aware that loading an app is not a compatibility test.
Probably not.

Also a must-read (surprised it didn't make it into this thread, which
mostly seems to have degenerated into quibbling about Gates and
Micro$oft):

Steve Jobs and the NeXT Big Thing by Randall Stross. Good, slightly
Jobs-bashing account of what NeXT was up to, what Gates was up to, and
what Apple was up to from 1985-1993. Required reading for people (like
me) who still use their Black Hardware. As much as we all feel a little
let down, we can revel in the fact that we own nifty pieces of magnesium
sculpture that you can get work done on, too.

Wolff

Bull! You are trying to put this argument on me, when as I have said
several times already I wa only replying to the implication in your
argument that this was so. The above quote was in direct response, (and
quotes directly from) your previous post, wherein you said that it has a
"larger footprint" and that "8 Megs is not enough". These were two
separate statements, but put together in such a way as to imply a
linkage. That is what I replied to you about in the first place and that
is what we havve been "discussing" ever since. Now you are trying to make
out like this is some "theory" of mine, when (as I have said all along), I
was trying to get som efactual repsone out of you due to the fact that you
seemed to be impying this in the first place. All you have done is make
snide comments back so far.

>
> Win95 has virtual memory so your logical argument about a 12MB
> recommendation for OFFICE implies that it would not load in 4MB is

Again, I don't know where you get "my theory" that office needs 12 megs
and would not load in 4. You are realy fond of putting words and
"theories" into other peoples mouths are'nt you?

Oops, have to answer the rest later, my Hydrogen powered Van-Pool awaits!!!

Jeremy

That is not the tone of what you said, but ok, so I suppose that Windows is so superior in usability and support that we need not even fear that anything better can come from overseas.

That is exactly what they said about japan eating the auto industry, don't you think it is wise to be weary?

t>note about improv munched

> So even *if* Mindreader for IndiaSoft comes out, what is to stop a Windows version from being released? Unlike IBM, MS has shown no reluctance in creating whatever APIs it takes to latch on to the next available technology. Remember the Pen Extensions for Windows?? That kind of fell by the wayside, but it can always be revived if or when the pen paradigm becomes viable in a big way.

Right, so we need not fear of anything ever really good enough coming out to displace Windows. Just because Improv or Pen systems didn't become a success, that ends the discussion and makes it impossible for anything else to be superior enough to dislodge Windows. Ok, I'm convinced, I'm glad I can stop worrying now.

> Yes this is happening, but *nothing* that we do can stop other countries from having a larger rate of increase, if they are starting from a low base. That doesn't mean, however, that we can't maintain a lead indefinitely. (I'm not saying that will happen.)

Yes, there is, we can prevent companies like MS from purposely slowing our rate of technological progress by not allowing them to practice anti-competitive, monopolistic business. And is precisely why Bill Gates is an evil person.

> MITI's efforts in this area have been a failure. What happened to the Fifth Generation Computer project? They were already supposed to have a "thinking" computer. Their non-alphabetic needs were supposed to translate into a huge success in releasing pen computers...hasn't happened, although they have, admittedly had success in certain specific areas, such as LCD screens and RAM chips.

Wow, did you know how many times japan failed in initially getting into the US car market. People used to appropriately laugh at the cars they produced. It may take time, but I would not recommend underestimating a japanese effort at doing anything.

> Still, even their hardware successes have been limited. Just ask NEC, which has tried in vain to be a player in the US PC market.

Ditto to above.

> Japan is a very rich nation. But throwing millions of dollars at a problem does not automatically lead to dominance. Just ask Sony, with the stillborn MD. What happened to the data MD, anyway? By the time it gets general release, *American* companies like Iomega will have rendered it obsolete.

The japanese rarely, and simply throw money to solve a problem. They are smart and eventually will succeed at whatever they try. Especially if we do nothing about it by letting Bill Gates depress our competitiveness. The fact that the may fail at a project or two shows at least they have the balls to try new innovating ideas. Something that we used to be known for.

> 2045 is a long way away. Notice, I never said that other countries won't overtake us in the long run. In the *very* long run, it is probably inevitable--no nation stays on top forever. What I am saying is that when this happens, it won't be due to the Evil Mr. Gates. It'll be due to a zillion other things...low American education levels, increasing capital investment in Eastern markets, the decreasing attractiveness of the US as an immigration ("brain drain") destination....

Of course it won't be SOLELY due to Gates, but he is a LARGE factor. And I simply will not believe that because no other country has stayed on top, we might as well give up the fight. If I become #2 at anything, it will be against my will to say the least. I think it's a
pretty lame mentality to say, oh well, we can't be number one forever, lets go eat some pie. However, you are absolutely correct in pointing out there are a multitude of factors contributing to decreasing competitiveness.

Among them are attitudes, that since we cannot be #1 forever, lets not try. And a factor worse than the aforementioned malaise, are supposed American's like Bill Gates who purposefully keep the US from being all it can be in the arena of software.

> Bill Gates has *helped* the US dominate foreign markets. His operating system crushed MSX, crushed independent European OS developments, and if or when, the torch is eventually passed to India or China, it will be more likely due to cheap labor than to greedy software magnate.

No, it won't be cheap labor, it will be more innovative products. The price of selling software to a mass market is less based on labor (probably not at all), but rather on potential mass market share. This, of course doesn't hold to MCCA type software design. Anyway, on an innovation level, you really need a well educated designer/developer to get you innovative new products that make you more competitive. And Gates may quash innovation in the states, but he can't quash every foreign government or industry. Foreigners will be free to innovate.

> So long as you are making sure your children are properly educated, you shouldn't have to worry about their future. As the US has become less dominant, the wealthy and

educated have not suffered, it is those of us without marketable skills that are left without
opportunities. Not GMs fault, not MS's fault, not anybody's "fault", really. If anything, you
can blame it on the successes of capitalism.

There are lot of educated people in the US that lost their jobs to foreigners. A LOT of jobs,
not just the assembly line jobs, went overseas with the auto industry that we lost. The
auto industry was and is THE LARGEST industry, and probably will remain so until
telecommunications surpasses it, about in the year 2000.

Many well educated people, a significant sized group, and a group whose size is growing,
not shrinking, are finding it more and more difficult to land jobs. Simply attending a
college, unless it's harvard :), is no guarantee of being employed.

I guess, at this point, before I get more, and I admit :), unreasonably testy, lets agree to
disagree.

You say, bill gates is not evil, his actions are not responsible for making the US less
competitive by stiffening US innovation by preventing competitors from bringing new
innovative products to market.

And I say the opposite, and he is evil.

> >Bad analogy. I'd use NS if it was free.

> You would?? I seem to remember a while back they were "practically" giving it away to students for $99. Not sure about that, maybe $199? Really, that is an insignificant cost compared to the price for a PC and for the software you would need to run your business. Even NTW at $299 is "cheap" if you are planning on buying $1000 of NTW apps that you need to make a living.

NS was never sold for either $99 or $199. Your memory like a pointer, pointing to something that doesn't exist :) As for 299 not being significant to a student, you are very wrong. I dare you to take a poll of students and ask them if they were willing to pay 299 for ANY software.

> Yes they have some very "nice" software, just like NeXTStep is "nice." But, oddly enough, what people think is nice and what they are willing to pay for to run their businesses are often two different things. Do you know anybody who is a programmer who doesn't think Windows 3.1 sucks?

And that is exactly why Gates is evil, because he purposely keeps Windows and his other products stinky. It's good for business. But the rest of the world will not necessarily be as
stiffled by his actions as are US software makers. And in the US suffers by being less competitive.

> The copies sitting collecting dust and the pirated copies cancel each other out.;-)

Hardly, Gates had it set up so that almost every intel box sold gave him a royalty on dos. He convinced people in the government, that because everyone is pirating his software he should get money no matter if the person wants windows or not!!! He did so not because of piracy as much as it was really a neeto way to become a monopoly. I guess when you can pay enough people off, you can even buy the government to not apply anti-competitive regulations.

> Seriously though, nobody could give a rat's ass whether there are 70 million Windows users or 7 million. It's the amount of software they purchase that determines what the marketing hags will eventually produce. There are far more DOS licenses out there than Windows licenses. Guess which platform has more packages produced for it, and why?

Yes, but I agree, not from a marketing view per se. But for the above reason that he forced people to pay for DOS even if they didn't want it, there by stiffling the industry from
putting anyother OS's on those boxes.

Exactly, why should GO continue on pushing the envelope of that technology, when it knows MS will just copy its innovations. If GO tries to sue MS, it knows it will go out of business trying to win the suit. So why bother innovating at all? So the whole US software industry says, hell with it. In the mean time, India, or Russia is moving forward with its industry.

To reiterate: bill gates is: a good business man, and evil because he knows he is hurting the US's software industry by practicing anti-competitive business strong arm tactics.

afford to have any kind of installations are educational institution. Now, why do you think people aren't developing apps for NS? It's all a matter of "market penetration" ie, catering
to the lowest common denominator.

I think you're right. One of the big reasons for MS's success is that people think Windows is free because it came with their machine. They don't realize the PC makers had no choice but to put Windows on the machine, even if they didn't want to put it on the machine the were still charged for it!!!!

anyone in any country. An OS must have software to support it. Next could give NS away for free and it still would have minuscule market
penetration (e.g. Linux). Give away cars for free??? Yeah, I'd bite, but it ain't happening.

This analysis is faulty on many levels, I'll tackle just the most obvious.

I did in no way say that the pricing was the issue, as it was with the auto industry. If anything I was talking about functionality and innovation and
why I e.g.'d Tucker. Sooner or later an OS will come out that will in metaphorically 'read our minds' or in some other sense be so advanced as to
push people away from their apathetic acceptance of Microsoft's products to perhaps a foreign software maker.

However, I completely agree with you, that even if NS was given away tomorrow, it wouldn't take away a significant marketshare from Microsoft.

> Software innovation proceeds apace in this country, as it does in the rest of the world. In fact, having an established standard of programming
makes it easier to write a better-mousetrap program and know that 50 million folks will be able to use it if wanted. Why is there Delphi for Windows,
and not for OS/2, Unix or Linux???

This is false. The _rate_of_increase_ of technological abilities and in particular software development skill is higher in other countries. In part
because they are catching up, but that is the problem, they are catching up--just like the japanese did. So if we are doubling our rate of technology
and have a rate of increase of 100%, India in the same quantum has a rate of 400%. Not to mention those countries, especially Japan, have special
government agencies that pour tons of government resources into improving software development. Check out japan, they have ministry or
department of software, and they feel like they cannot penetrate our market and are killing themselves to figure out how to crack our software market
(this of course doesn't pertain to the software gaming market, which in all practicality, they own). How long do you think it will take japan with the
zillions of dollars and other huge resources to concur us on this front?

> I am no big fan of Bill Gates or MS, but this idea that other countries will outpace us due to his stifling influence is without merit. Probably the

country with the greatest per capita software innovation is Israel. Yet you don't see Israeli software overrunning US markets.

This is the same head in the sand mentality that defended the big 3 auto makers in their killing of innovators like Tucker and which in the end lead to
the japanese eventually gaining a huge marketshare. Gee Mr. President, please let us drive Tucker out of business, it'll be too tough and expensive
for us to upgrade our facilities, besides, it couldn't possibly cost us the US dominance in the auto industry. The big 3 paid off a lot of people in the
government to be able to get away with the monopolistic anti-competitive actions they took. And you better believe that MS has greased many a
politician's hand in getting away with what they have done. The last justice department investigation is a primo example.

Lets see, from tucker to say 1985 when the japanese had really become established, that is say roughly 50 years. So tomorrow Israel wont take
over, but what about 2045. I tend to worry about the future and what kind of opportunities my kids will have. I prefer not to be short-sided or to
REPEAT OUR MISTAKES OF THE PAST. I prefer to look to the future and learn from the past. I prefer that my country not make the same mistakes
twice. We don't have many more industries to give away.

I have no idea whether it is relevant to Windows 95, NT, or any other particular operating system, but while it would, indeed, be "unusual" for an OS to load itself into "virtual memory"(*), there *are* operating systems that do just that. The only portions of the operating system which *must* be resident in memory are those pieces of code and data which are used during page-fault recovery. Some operating system designers have gone to the effort of identifying exactly those routines (plus performance-critical routines, i.e. you'd rather not page out your clock interrupt code) and ensuring that those pages, and *only* those pages, are wired down, allowing the rest of the kernel to be paged. (As I recall, it has been claimed that Apple has done just this for Copland.) This allows an OS to have a large "virtual" footprint while limiting its actual memory footprint to commonly used routines, adjusting that footprint to the actual job mix at any given time.

(*) I.e. "phony" memory as extended by paging; lots and lots of operating systems use virtual addresses of wired physical pages for their code and data.

Your right, it is a counter-example, I wasn't being fair :) But I think you see my point,
and
there is a distinction between these examples. Namely that if Improv or Pen fails the
companies go on, but when 3 companies conspire to drive you out of business and
succeed, you're gone permanently.

> No, this will not stop foreign competitors from having a larger rate of increase. If Sri Lanka goes from producing fifty software products a year to a hundred and fifty, they have tripled their output. No power on Earth is going to make the US triple its output in a year.

This is not right... Ok, say Gates is dampening our rate of progress by 50% (it probably isn't this high, but this is for sake of mathematical ease). Normally we would grow by 100% a year and now we grow only by 50% because of him. Now say SriLanka grows by 200% a year and is unaffected by Gates. Won't it be more difficult for SriLanka to catch up to us if we are traveling at 100mph, than if we are at 50? My point is, he is making it easier for foreign countries to catchup and surpass the US by dampening domestic innovation and competition.

> Don't overestimate it either. Japan is not some Super Powerful All-Invincible Force. Such thoughts only unreasonably add to Japan/US tensions. You are right in noting that they are a very powerful and formidable competitor. But their time in the sun will pass too,
eventually... (Maybe you are unaware that Japan continues to be in a painful recession. Painful from the Japanese standard, that is.)

I guess this is in my cautious lawyerly manner to NEVER EVER UNDERESTIMATE AN OPPONENT. I know they are in a recession, and recessions are part of any developed economy. They come and go. Maybe there time will pass, maybe it won't. Right now, they are an economic opponent of the US. I don't really care if this causes tension, because it is fact. They are not our partners. They, quite wisely, seek to exploit our market to the fullest, and are not looking out for our best interests, and it is not there job to
do so. It is our job to do so.

> I am bringing up examples, you are bringing up Japan, Inc. A bogeyman.

A lot of companies have been bogeyed by this bogeyman. He's for real and he means business.

> Being smart and racking up an impressive list of past accomplishments does not mean that you will eventually succeed at everything. Look at the U.S.

I don't think the US was particularly smart for: underestimating the Japanese, getting fat and lazy and producing poor products, becoming so conservative as to pass on innovative products like the VCR. Quotes abound from executives in the domestic auto industry in the 70's to the effect that "the people will drive any damn crap we make." This kind of attitude is hardly smart and largely the cause of the US's arrogance which resulted in the creation of Japan Inc (one of our biggest competitors). We made our own bogeyman.

> And why do you think that anti-competitive practices are bad in the US but good strategy when the Japanese do it?

Because, unlike the Japanese, we don't have a miti. There is a Japan Inc, there is no US inc. When our companies die, they die period. Our industries die. Look at the TV home electronics industry. We used to own it. That industry is for all practical purposes, dead in the US. Japan Inc doesn't allow this to happen. The keep lame companies afloat if it is in an industry they want to participate in, for example, their software industry.

> We still are known for it, in the software industry. And in case you didn't notice, our automakers have not rolled over and played dead yet, either.

Thank goodness :) That is one think I'm really proud of as an American. We didn't fall all the way into obscurity. We _seemingly_ are smart enough to wake up and respond and not make the mistakes that other great powers of the past have done. All great powers seem to succumb to the " I'm so great, I guess I can rest on my laurels " mentality, which leads to their eventual downfall. I never want to the US to rest. I'd rather it be ever vigilant. I hope that the auto debacle, and lost TV industry are lesson enough; that from hence forth we fight everything out tooth and nail.

> >Among them are attitudes, that since we cannot be #1 forever, lets not try.
> When has this *ever* been a factor in decreasing national competitiveness? Usually it's the other way around, "We are destined to be #1 forever, so we really don't have to put much effort in it."

You must be joking? Are you trying to say the "lets not try" attitude is good for national competitiveness? Should we make it our national labor motto "We cannot be #1 forever, so lets not try." You are right, being cocky is a recipe for failure, but not trying is a guarantee for failure.

> You have failed to establish, even that he is quashing innovation.

Ok, lets see. I make a compression routine. MS copies it. I loose all my money suing them. I eventually win the suit, but no one uses my product anymore. They simply change a routine and I'm dead out of the market. First, I don't want to do anymore development because I figure if it's too good an idea I'll just get ripped off by MS. Second, an outsider observing this, will to decide to stay out because his efforts are likely
to be un-rewarded through such anti-competitive practices.

Funny, even if you win the suit you loose. Many developers, just don't bother because MS owns the industry. No one is exactly entering the WP or Spreadsheet market. Is it because it's not lucrative, or just not worth the fight against MS?

> Unemployment rates for college grads has barely budged since 1975.

Ahh, rates, but the gross numbers are up. Plus today a college grad can expect to hit the "toughest job market in over 20 (or is it 40) years" as been echoed through the news. College students are taking worse jobs and lower paying jobs than equally educated people were in the 70's or 50's. I don't remember why we got into the labor discussion though :-)

> all? You are aware that loading an app is not a compatibility test.
> Probably not.
> J. C. Coughlan, jcoughlan@gaia.arc.nasa.gov

This is typical though. I have read the same responses to your posts and
two of them were from people who claimed to have loaded Corel Draw, ran
it, played around with it, tested it etc. ONe in particular was quite
specific on the fact. Yet based on *nothing* except a statement you *read*
from MS, you claim to be right about it not running and further that the
"folks" that posted the replies to you are just wrong. And you claim not
to have a major "smuggness" problem or any over-arching need to be right?
You are pathetic.

This whole post started off as your attempt to put forward the idea that
people would need to do a major upgrade of hardware and especialy memory
to run Win95, and I pointed out that the requirements in that regard were
the same as Win3.1 and that the experience of most people who have
installed it was that it did indeed run as fast or faster than Win3.1 in
the same memory configuration.

Then it goes all over the map and back arguing about everything under the sun except the original post, and all it boils down to is your (finaly clarified) statement that because it has a larger memory footprint it needs more memory than the 4MB. You have yet to provide any information on the actual size of the memory footprint, (ie- it would have to be larger than 4MB to give your arguments any real weight), other than tortuously worded statements that seem to imply (variously) that it is larger than four or maybe even larger than 8 MB. Again, this is a theoretical argument you have constructed out of things you have read or heard, versus the fact that people actually running the program and testers like myself have an entirely opposite experience.

Of course none of the actual experience of the users or the testers could possibly be of interest to you since that would necessitate you changinf the Joseph Coughlan view of the world, which would not do at all.

Jeremy

In article <3tmt31$l86@newsbf02.news.aol.com>, bootstrap1@aol.com says...

>What everyone has been saying is that a) Win '95 is larger than Win 3.1
>and b) Win '95 is large enough that it will cause swapping on a 4 MB
>machine. This means that for adequate performance you need an 8 MB
>machine, whereas with Win 3.1 adequate performance needs 4 MB.

Nope.

Or at least this is true to a degree only.
Win 3.1 with 4MB running Word 1.0 may not have swapped alot (although
I have a feeling it did, just can't remember...). But believe me
when I say Win 3.1 with 4MB running Word 6.0 swapped like a mother.

Win 3.1 in 4MB running the _same_ applications as Win95 in 4MB will
swap just as much as Win95--the difference is that Win95's disk I/O
is a sorry sight better than Win 3.1 (note, I'm talking about
the generic vanilla Win 3.1, not WFWG 3.11 which has 32-bit disk
access).

>BTW, on the subject of OS footprints, I don't know how big Win '95s is,
>but I do know that on my system Win 3.1 has a 3.5 MB footprint.

Hmmm, wasn't the minimum RAM requirement for Win 3.1 2MB?
Or is my memory getting that faulty?

>It wouldn't be surprising
>at all if Win '95 took up more than 4 MB of RAM, which obviously would
>require swapping on a 4 MB machine even without running any apps.

Umm, how would the OS swap (ie., use virutal memory management in
someway) if it can't even load itself into RAM? There is a core
minimum RAM space required for any OS to even boot properly. NT
is around 5MB. Win95 _has_ to be lower than 4MB in order for it
to even boot.

The above requirement has nothing to do with how much RAM an
OS takes up after it boots up. For example, after NT boots up
in a 48MB machine (I remember checking this back when the
machine I used was a P5-90/48) I checked the free RAM and it
reported only 12MB! Of course that didn't mean squat in terms of
what I could run under NT or what NT required to work.

...so let's shoot them down.

I'll entertain the notion that CP/M preceeded Microsoft -- it did, but
it was a hobby of Kildall in 1974, not a commercial product. He sold
it commercially in 1975 to two customers. This was the same year that
Microsoft sold their BASIC, so who was first is a toss-up unless
somebody can get real dates of incorporation. For the sake of
argument let's give it to IDR, because he definitely had his stuff
done first even if it wasn't commercial.

The Imsai was the first publicly available microcomputer product with
CP/M, in 1976, so software written for CP/M originally post-dates
Microsoft.

VisiCalc and WordStar were both written on CP/M, so they're followers.

Lotus 1-2-3 was written on MS-DOS -- it wasn't even close.

I think Apple started in 1977 -- certainly it was after the Altair
shipped, so they were followers. Apple didn't get into GUI
development until the 80's, so the MacOS wasn't even in the ballpark.

Historically yours,

That all depends. Who thought P5's would be in the home market?

Intel accelerated the P5 to keep the lead over the pack. If IBM's 620
or AMD's CPU or NextGen start eating into P5 sales then all bets are
off. AMD claims to be ready with a mass prduced K5 in 1Q 1996.

What you probably meant to say was that the P6 won't ship in quantity
until Intel decides that they have made as much money off the Pentium as
possible, which is about the same time that the Pentium clones catch up.
The P6 could be reasonably affordable now; the only reason it isn't is
that Intel doesn't want it to be yet. But this is a recent decision; this
spring, they were still encouraging OEMs to prepare entry-level P6
systems, but now they've changed their tune and suggested that OEMs should
wait another year.

>You must be joking? Are you trying to say the "lets not try" attitude
>is good for national competitiveness? Should we make it our national
>labor motto "We cannot be #1 forever, so lets not try."

No, what I am saying is that "let's not try" was *never* the attitude in
this country, except perhaps for one brief era of detente, which went
along with demoralization directly and specifically related to the Vietnam
War. I believe our problem has always been an underestimation of our
opponent, not an underestimation. In other words, we tend to believe that
we are unbeatable, not that we have already been beaten.

>Ok, lets see. I make a compression routine. MS copies it. I loose all my money suing

likely
>to be un-rewarded through such anti-competitive practices.

Oooh. This is something different entirely. You are not arguing against
MS specifically, you are arguing for a reevaluation of our patent laws in
the software industry. There is something to that, perhaps.

BTW, in an *amazing coincidence*, the lead story in this week's (July 8)
The Economist is entitled, "How dangerous is Microsoft?"

Just a few, choice, pro jlopez quotes: "The result is a vibrant software
industry: many of Mr Gates's 70,000 rivals are thriving. The industry
grew at 11% last year, making it the fastest-growing service business in
America...tellingly, MS's applications programs have a greater share of
the Apple-Macintosh market than of the PC one--even though, in that case,
the firm lacks the supposed advantage of owning the operating system."

The article goes on to advocate "keeping an eye" on Bill Gates, but not
impeding him, for now. I think that's reasonable enough.

>MS owns the industry. No one is exactly entering the WP or Spreadsheet market. Is it
>because it's not lucrative, or just not worth the fight against MS?

Hah, IBM just bought a small applications suite called StarOffice, which
it hopes to parlay into a big player in the OS/2 and eventually Windows
market. (Oops, I think StarOffice was produced by a German startup...bad
example, maybe...) Anyway, the WP and Spreadsheet market is mature,
which is why there is not much room for growth. Let someone come out
with an incredible new Spreadsheet paradigm as revolutionary and
immediately useful as Visicalc, and we might see some improvements.

Re: PEECEE History...
Anybody out there *own* Visicalc? Just curious how much space it took on
floppy...(Did they even have a "hard drive installation"?) Was it
written in pure assembly language, or some sort of P-code?

One issue is whether an OS has to swap at all when running an app, and certainly if you have enough RAM to to prevent any swapping, you are going to see a performance improvement.

HOWEVER, a second issue is the degree to which an OS has to swap, how often page faults occur. This is a factor not only of the amount of RAM you have, but also the nature of the swapping algorithm and the design of the OS and apps you want to run. Word 6.0 may have swapped like a mother under Win 3.1 in 4MB, but it is very possible that it may swap *more* under Win '95, and that means poorer performance.

The reason it might swap more is that every app, every OS, has core code & data that gets used all the time, along with a lot of peripheral code & data that gets used occasionally. A good swapping algorithm will try to keep the core code & data in RAM as much as possible.

For the sake of argument, let's say the core code & data of Win '95 and Word 6.0 push us 500K over the 4 MB we have on our machine. A good bit of swapping will occur, since you are constantly swapping core code & data for other core code & data; yet, it may not be too much of a hit, because only 11% of your core code & data will cause a swap.

Now let's pretend that Win '95 has 1 MB more core code & data than Win 3.1. That means that, running Win '95 and Word 6.0 on a 4 MB system, we are now 1.5 MB over our 4 MB limit. Suddenly, 27% of our core code & data will cause a swap if called; we're now 2.5 times more likely to swap.

>Win 3.1 in 4MB running the _same_ applications as Win95 in 4MB will
>swap just as much as Win95--the difference is that Win95's disk I/O
>is a sorry sight better than Win 3.1 (note, I'm talking about
>the generic vanilla Win 3.1, not WFWG 3.11 which has 32-bit disk
>access).

No, there are degrees of swapping. The larger an OS, the larger the core code & data, the more likely you are going to swap in a low-memory situation like a 4 MB machine. And while Win '95 disk I/O is improved, there is no way that improved disk I/O makes up for increased swapping.

>>BTW, on the subject of OS footprints, I don't know how big Win '95s is,
>>but I do know that on my system Win 3.1 has a 3.5 MB footprint.
>
>Hmmm, wasn't the minimum RAM requirement for Win 3.1 2MB?
>Or is my memory getting that faulty?

An OS can run in 2 MB and still use more RAM, since a large part of an OS can reside in the swap file just like any app. Probably at least 1 MB or more of the 3.5 MB Windows uses on my system is "discardable" code and data that can be deleted and reloaded if necessary. Of course, that requires the same kind of performance hit (worse even) than virtual memory swapping.

>Umm, how would the OS swap (ie., use virutal memory management in
>someway) if it can't even load itself into RAM? There is a core
>minimum RAM space required for any OS to even boot properly. NT
>is around 5MB. Win95 _has_ to be lower than 4MB in order for it
>to even boot.

There's no reason you couldn't design an OS that only needed a couple-hundred K or less to load itself, and use virtual memory for the rest. There's a performance hit, naturally. I'd suggest that, for Win 3.1 to run in 2MB, a good bit of the OS is in the swap file any time an halfway decent sized app is run. The performance would be really lousy, and that's why none of us do it. :)

mfterman@access5.digex.net (Martin Terman) wrote:
> I doubt Bill Gates is slowing much of anything down in the hardware market, which is where the Japanese will probably be the most serious threat. In the software industry, different rules apply, and Japanese companies would have the same problems that US companies have in going up against Bill and company.

This is not so, foreign competitors are more insulated from MS, because they have an edge in there foreign markets, and they are buoyed by their governments. This is particularly so with japanese companies; it is the norm and not the exception to be subsidized by the government in japan. So foreign companies can weather MS's anti-competitive practices much better than domestic software makers.

> The Japanese are not the invincible gods that the press makes them out to be. And their strength is more in hardware than software. Even there, they tend to do better in some areas than other areas. RAM they are incredibly good at, but you'll notice that they haven't made that big an impact in CPU design.

Maybe today they are better in hardware than software, but if we let our software industry degenerate to the level MS would like it to, then you will see the japanese or some other foreign agency take a leadership position. Furthermore, they do and did make an impact on CPU design, I believe the fastest CPU is a fujitsu (I could be wrong on which japanese company it is, but its one of them). So just because they haven't blown the US market open doesn't mean the won't, given some time and a perpetually declining ability to compete which is agitated by MS's anti-competitive practices.

> I don't think the Japanese are going to be a serious threat in the software industry anytime soon. India, on the other hand, that is a threat I take more seriously. They're turning into a serious software powerhouse over there, and given the resources with which they're doing it, I am impressed.

Personally I don't care who the threat is. My point is that MS is making the US less competitive by discouraging domestic software makers from innovating and thus making it easier at some future point in time for a foreign country to take the US's current leadership
position in the software industry.

> Bill Gates does threaten to strangle us software-wise. However I don't think it will happen. Software is a much more nebulous quantity than hardware, and its easier to slip from the top. I think this is some of the reason Microsoft struggles even harder these days to keep their top position. Once they slide down, its going to be very hard for them to get back to the top.

I'd argue that it already has happened. The US, is quite simply run on windows.

> The price of software is heavily determined by labor. Software is the industry where the manufacturing costs of the product are low on the list of things to worry about. Writing the
software in the first place is a major hurdle, and promoting the software and supporting it are also money sinks. Manufacturing is more trivial. A CD costs a buck to stamp out, and manuals aren't that expensive to produce in bulk. (well, not cheap, but compared to the other costs involved its not the biggest worry)

I'd argue that the difference between hiring 1000 indian programmers, v.s. 100 US programmers who can do the same is zilch. Right now india, by and large is used as an outsource to do grunt programming. You will always need a primo educated designer, and no matter if that designer is indian or US or japanese borne, the price of his education
will be reflected in the high cost of his labor. But quite frankly, the cost of labor to code
windows is relatively small as compared to the revenue generated by windows. That is why windows goes for around $50 bux. So I think your statement is wrong, namely that the price of software is determined by labor. The price of software is determined by the size of the market. e.g. Windows sells to a zillion users, so they sell for $50 bux. NEXTSTEP sells to 10 users, so they sell for $5K. The size of market affects the price of software more than labor.

> On the bright side, Gates can only stifle the industry so long as he stays on top. Once he slips his grip on the industry, I'm fairly certain things will balloon back. That might be
due to foreign countries producing hot software and then taking it over to the US. Bear in mind, we're one of the more computerized nations around, we're a hot market.

Exactly what I want to avoid. Why do we have to loose our lead to a foreign country, just to get out of Gate's sniffling grip? It is the Justice Dept's job to prevent this from happening, but it appears that all of them were paid off by MS and their consciences can live with possibly handing over the US's leadership position in the software industry to a foreign agent.

2164. Apple has given up!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-07-11 00:00:00 UTC
From: trauth@paul.rutgers.edu
Message-ID: <3tuo78$87s@paul.rutgers.edu>
Source record: 11918

Hey Sinflop, it looks like Apple management has pulled
a "Tramiel"! I read today in c.s.mac.adv that Apple told
MacWeek that they have given up trying to increase the Mac's
market share and will instead concentrate on its (small)
installed base.

What a great thing to announce right after the excitement
generated by the release of the first 604-based Macs! What
a great message to send to potential Mac cloners and IS
managers everywhere: Apple intends on keeping the Mac a
niche product and has given up on its efforts to make it
more mainstream!

If this announcement represents Apple's true corporate
strategy, they have essentially raised the white flag and bowed
down to Emperor Bill and his Evil Empire. The war is over and
Microsoft has won!

So, Petey, remember next time you put down Atari as a "dead"
company, don't forget that your beloved Apple will soon be equally
dead.

LONG LIVE THE JAGUAR!!

* Tom

Don't compare Tramiel to Apple mgt. Not even close. Any day now, Applw will
post record revenues and earnings. Nice try!

Well, you have been told wrong. I suggest you read the MacWeek article
carefully. Apple is concentrating in the four markets that they rule -
Publishing, Home/small business, K-12 and Higher education. Mac OS clones will
increase the market share in markets that Apple is weakest in. Radius has
signed IBM to I built a Mac clone and PowerComputing plus many others on the
way.

Plus Apple will roll out a 100 million plus marketing camapaign through
December attacking Wintel 95 head on.

Mac Cloners welcome it, since their is enough pie to go around. The Mac is
mainstream. Hundreds of Macs locally. More Powermacs are being installed on
Campus as well as individuals and the k-12 schools.

Nope.. Wintel 3.1 garnered the most, Apple is here.. No different..

How about MS Fortran Powerstation, and nearly all comm apps. MS probably made sure
Wincim and AOL's present front-end won't run so people will be more willing to try
MSN. And most programming apps won't run including, according to our systems administrator,
Visual C++ 2.0. If you want it run Visual C++ in Win95 you have to get ver. 2.1.
I don't know what MS is charging for this, but if it's true then I find it's kinda funny
that
the programing app that MS has been pushing for Win95 development won't run
under Win95. It wouldn't surprise me if MS put code into Win95 to make sure
Borland C++ 4.5 doesn't run. Remember, "Dos isn't done 'till Lotus won't run"??
It's time the DOJ broke up MS before this whole joke stops becoming funny.

> remember?

You are right with those examples, but I hope you would agree that
Japan compared to the US, outright subsidizes its industries. The
US has stepped in to clean up some of our nasty messes. But
certainly not on par with Japan Inc :) Personally I like our free
market and I think it is an EMBARRASSMENT when the government has
to help out. It shows a weakness and a professional inability.
It certainly is mud in the eye of Citibank and Chrysler, but I
would also add, even though it is largely not viewed this way, it
is mud in the eye of Japanese companies. They don't have the balls
or the professionalism to compete on their own merits, but have to
look to mommy for protection. I think competition is the ultimate
in creating innovation. That is why Japan is largely good at
refinement, but not in creative innovative ideas? Why should they
be, they don't have to beat anyone in Japan, they are all friends
over there.

> No, what I am saying is that "let's not try" was *never* the

> unbeatable, not that we have already been beaten.

If you'll notice, that period coincides with the auto debacle :)
You are right, that in general the downfall of any great power is
self-contentment and belief in invincibility. However, I was
promoting being extra vigilant in that someone might kick us good in
the pants, and I believe you were saying I shouldn't worry too much
about Japan. That's why I went to the extreme of the "lets not
try" notion, to say that is not a good attitude either. It's good
to be worried a bit and look over your shoulder to see what the
competition is doing.

> Oooh. This is something different entirely. You are not arguing
> against MS specifically, you are arguing for a reevaluation of
> our patent laws in the software industry. There is something to
> that, perhaps.

Well, yes and no. MS violated a copy right law by doing this, so
the law is good for a start. But the penalty wasn't damning
enough, and the winner of the suit wasn't compensated enough. So
I say the law is good, what we should have is more competent judges,
and better and harsher enforcement. You'd be amazed at how
incompetent (technically) players in the legal system are, especially
Judges.

(Let me digress a bit, why not this thread has gone on way beyond
its usefulness :-> In a hearing to see if a Computer Accident
Reconstruction could be used to aid in an accident case in NJ, the
Judge had to be informed what a floppy disk was!!! I'm not making
it up. The short of the matter was, that the reconstruction was not
admissible. Even though bunch of other states have made such
evidence admissible. I guess it was too darned complicated to
watch the pretty pictures :-)

> BTW, in an *amazing coincidence*, the lead story in this week's
> (July 8) _The Economist_ is entitled, "How dangerous is Microsoft?"

Really, I let my subscription run, darn, I'll have to pick up a
copy, unless someone has it and can send it to me electronically...

Yea, I bet I could find a few choice quotes myself ;) You know the
old quip about economists? Ask 10 economists their opinion, get
11 different answers :)

> Hah, IBM just bought a small applications suite called StarOffice,
> which it hopes to parlay into a big player in the OS/2 and
> eventually Windows market. (Oops, I think StarOffice was produced

I'll let the above line stand on its own merit ;-)

>Anyway, the WP and Spreadsheet market is mature, which is why
>there is not much room for growth. Let someone come out with an
>incredible new Spreadsheet paradigm as revolutionary and immediately
>useful as Visicalc, and we might see some improvements.

They did, Improv, it went nowhere. 123 and WP are dying off slowly.
Just look at a place where MS doesn't have product. The graphics
market. Certainly mature. There are literally hundreds of Pixel
and Bezier apps out there. Now look where MS does have apps,
wordprocessing and spreadsheets. In wordprocessing there is only
one minor competitor of worth WP, and a few fringe players Nisus,
AMI, MacWrite and that is about it. A company looks at the
wordprocessing market and knows it has to go against Word and says
why bother, and doesn't bother to compete. We loose a lot of
innovative ideas that way. The same is true for spreadsheets.
Excel has only 123 as a real competitor and one or two fringe
players. No one makes new spreadsheets or wordprocessors, but you
constantly see new graphics programs. Is it just a coincidence
that there are no MS graphics programs? Maybe, I, however, tend
to think MS drives out competition and prevents innovation.

: 3do is moving along fine for now. What a rabbid Atari defender.

That's "RABID." And you want to be a librarian! I do not defend
Atari's mistakes or problems. I do defend against people like you who
constantly ignore facts and exagerate in an attempt to bash a product and
insult people.

: Atari has very very few developers as I recall.

Recall them.

Atari would of been bankrupt
: without the Sega infusion.

Says who?

That was stated before the cash infusion.

No, it was stated that if the patent issue wasn't settled, Atari
was going to proceed to the equity markets for more capital. Read
carefully. In addition to that Sega infusion, Atari also got money from
Nintendo and TWI.

Atari
: has not been able to take advantage of the money.

Really? What do you call those "Mortal Kombat III" and "Batman
Forever Liscences?"

The Altair predates the IMSAI. I don't think it shipped with CP/M. I
have a few issues of Creative Computing from 1975, with ads for the
Altair.

|> VisiCalc and WordStar were both written on CP/M, so they're followers.

VisiCalc was written for the Apple][.

|> I think Apple started in 1977 -- certainly it was after the Altair
|> shipped, so they were followers.

Steve Wozniak was building the Apple prototype in 1975. The Apple][
went on sale in late 1976. The Disk][was introduced in early '78.

Like it's predecessor, the Atari 8 bit series. It isn't multi-processing,
the Antic/GTIA/Pokey Agnus/Denise/Paula chips are coprocessors (like a
Mach64, a DSP or an FPU).

>(Please correct me if I'm wrong on that.) It wasn't "big" and

More expensive than an Atari ST, that machine was earlier, BTW, but
technically inferior.

>with their hardware.

You can still buy them in Europe, AFAIK, and new models (at first, just
repackaged '93 models) will come soon.

If memory serves - the Apple II was introduced in 77. The Apple I was introduced in 1976 (for ~$700). It came with a main circuit board screwed to a piece of plywood (case and power supply not included). There was supposedly very few made (I think I read that collectors have paid as much as $20,000 for one a few years back).

> to the contrary.

Joseph Coughlan *implied* that this was so, and alot of the confusion has
been me trying to pin him down on: a) how big he thinks the "footprint"
is, and b) Why he said in the same sentence that 8MB was "not enough" to
load Win95.
>
> What everyone has been saying is that a) Win '95 is larger than Win 3.1
> and b) Win '95 is large enough that it will cause swapping on a 4 MB
> machine. This means that for adequate performance you need an 8 MB
> machine, whereas with Win 3.1 adequate performance needs 4 MB. This was
> my original contention, which you have disagreed with, and have been
> proven wrong.

You should check what I wrote. I have never disagreed with the above. I
know Win95 has a bigger footprint, it is still less than 4MB. Win95
causes swapping on a 4MB machine, but so does Win3.1, the swapping for
Win95 *may* be more, but no-one has yet posted any information on this
although from reading one of your later posts I know you have quite an
elaborate theory built up on this. I never disagreed that Win95 will give
you much better performance in 8MB than 4MB, and that this is the
recommended amount. The whole argument I was having here was over Joseph

Coughlans implications that there was a significant rprefomance drop with Win95 in the same meory configurations, and that Win95 just "doesn't work" in less than 8MB. I know you also agree with these statements to some degree but they are wrong. I won't get into the detail of your other longer, later post because I can't quote it here anyway, but you put up a detailed theortical situation as to how the swapping in Win95 *could* be (i think you say *is*) more prevalent than in win3.1 and that even the better I/O of Win95 won't make a difference. This is a good theory, but in practice it just isn't right. Since no-one has posted the actual footprint size and the degree of swapping for both systems or the exact parts of each system that has to be swapped, I would put forward that it is all too hypothetical to be taken seriously. In lieu of this information, what we should go by in this case, is the *experience* of the user and *testing* of the end product. All the testing I have seen since the preview Beta came out shows that Win95 does indeed run as fast or faster in 4MB as Win3.1 did, this is also the experience of *most* users of the product. the later builds are even faster.

I am not trying to disown your theory, only that there are many unknowns in it that you have made assmptions about and given the fact that testing and use of the end product simply does not give the results that you predict....

> BTW, on the subject of OS footprints, I don't know how big Win '95s is,
> but I do know that on my system Win 3.1 has a 3.5 MB footprint. In other
> words, if I turn off virtual memory, reboot the machine, and then check
> the amount of free memory in the Program Manager as soon as it comes up,
> it tells me I have 4.5 MB free on an 8 MB machine.

This is wrong,I think the other guy pointed this out to you. the "footprint" at least with Windows systems refers to the minimum necessary space in real memory that the OS needs to load itself. Some OS's like copland it is rumoured, can swap out parts of the actual OS, but in general, the "core" OS has to load into real memory and remain there. with Windows 3.1 it can do this in 2MB, but it isn't pretty. The fact that MS is saying the mimimum requirement for Win95 is 4MB, indicates to me that it's footprint *is* definatley bigger, probably somehting around a 2MB or jsut above, minimum i would think.

> I do have Win32s
> loaded, so that will gobble up some additional RAM I'm sure, but in all
> other ways it is a clean Win 3.1 installation. It wouldn't be surprising

No, it weould not load if this was the case, it ertainly would not give even near Win3.1 performance even if it did manage to swap out parts of the core OS.

> which obviously would

If you had read the release, you'd realize that apple had indeed changed its growth focus from market share to providing a wider range of products and services to its installed base. Apple will look to clones to build market share (which then can buy apple products and services). Their long term goal is to become an OS and service provider, not a HW manufacturer.

Maybe...System 7 is here...Win 95 is "coming" (possibly with a HW copy protection dongle to hang off the back of your machine). If consumer OSes sold on the basis of technical superiority, the whole world would be using NT or OS/2.

Copland is really aimed at CHRP, any pre-CHRP Copland releases should really be considered like evaluating Win95 beta on a 486SX. Apple is betting the farm on a CHRP/Copland configuration which will (hopefully) be

as radical a step forward as the original MAC. Personally I see CHRP as being more of a help to MS than Apple...many Macophiles would consider switching if windows was as easy to configure and support as a mac (something that CHRP could well provide).

AHAHAHA!!! Who's "in denial" now, Petey?!

>Well, you have been told wrong. I suggest you read the MacWeek article
>carefully. Apple is concentrating in the four markets that they rule -
>Publishing, Home/small business, K-12 and Higher education. Mac OS clones will
>increase the market share in markets that Apple is weakest in. Radius has
>signed IBM to I built a Mac clone and PowerComputing plus many others on the
>way.

Blah blah, blah, blah.... SO WHAT!? Can YOU decipher what is being said
here?! Apple is adopting a defensive policy, they are going to try
to hold onto what they do have! This can be a VERY STUPID policy for
a large company like Apple!

Even ATARI (yes, little Atari) is focusing on expanding the user base
of the Jaguar. But Apple seems to be content with what it has and is now
focusing on keeping that niche, which is an interesting future indicator.

>Plus Apple will roll out a 100 million plus marketing camapaign through
>December attacking Wintel 95 head on.

Do you think that will have any effect?! Hell, no! King Gates has
leveraged most PC manufacturers in carrying his products, thus
establishing a powerful user base in the context of "free" software
that comes with those PCs. Apple will have little/no effect on
Win95. Microsoft expects to ship 30 million copies of Win95 this year
alone.

>Mac Cloners welcome it, since their is enough pie to go around. The Mac is
>mainstream.

Denail, denial. There is very little pie there for the Mac. Most of
it is the competition.

> Hundreds of Macs locally.

Yeah, locally in your bed. Macs are a "sexy" thing to you, aren't they,
Petey?

>> If this announcement represents Apple's true corporate
>> strategy, they have essentially raised the white flag and bowed
>> down to Emperor Bill and his Evil Empire. The war is over and
>> Microsoft has won!

>Nope.. Wintel 3.1 garnered the most, Apple is here.. No different..

More denial. Apple's announcement is not a good sign. It indicates
that their market influence has waned and they are focusing on keeping
what they have. Much as I hate to see this happen, it looks as
though Intel and King Gates have won. The ST failed, the Amiga failed,
the Apple will be the next victim in our new computer age.

Face it, Sinflop, Apple will never be a standard. Much like the ST and
Amiga failed in becoming a standard. The only hope you have clinging
onto a Mac in this world is the hope of not being isolated and ridiculed
as the rest of the computer industry moves in other directions.

>No comparison between Atari and Apple. Apple sells millions of units annual
>and profitable. As for Atari, nuff said..

But Apple lacks balls. At least Atari is still trying to expand the
Jaguar, using an offensive mentality. Apple has become mush.

>The Atari Jihad....not as powerful as Iran, but equally fanatical.

Peter Sinclair... not in the same age as the Neanderthal, but equally
dumb.

There's also little question that Mac software is superior in ease of installation and support...but that won't convert anyone either...selecting a computer and OS is usually not a rational decision.

> Then why the heck is Apple supporting CHRP?
>
Easy...it's the right thing to do. HW/OS independence is a concept almost as radical as the original mac. Combine CHRP with the open doc/OLE initiatives and you have a rewritten scenario for end user computing...a scenario where the user and his/her needs are are predominant rather than HW, OS, or apps. Apple is betting that it can compete with Gates and company even when the shorcomings of current and future wintel offerings are mitigated by CHRP. While I'm not sure they can pull it off, they're certainly showing some balls for trying.

It's also a "good thing" to have more than one major player in the consumer computer (HW/OS) market
>
> And as for Mac clones, from what I've heard there won't be any normal ones

Agree 100% on that one...I really expected the clones to attack the high-volume low-end (680X0) first...cheap, expandable entry level systems. Oh well, like you say, next year (maybe)...kinda sounds like Atari doesn't it?

peace,
paul

We have a chap in New Zealand here who for a number of years has often,at the first opportunity, taken it upon himself to open his heart to Atari computer owners about how bitter and twisted he is about life. In particular, Atari life. He gets really wrapped up in himself, but also really imposes himself on people under the proviso "I speek the truth" (his spelling.)

I feel this is has no real worth in these areas, he is not a person who is that interested in genuine help and communication, which is the great thing about the Internet.

His negative frame of mind cripples him very often, even when he attempts to give advice, his psychology overwhelms him. He uses the net alot, it seems, especially these areas.

In New Zealand, Atari is not commercially supported anymore, but there are still a good number of owners here and there is a new wave of new owners who have bought up 2nd hand machines as others move on.
For those that want to stay with the Atari machines, there is help and support in New Zealand, we simply are not interested in people like Rodger Shepherd who very obviously are not interested in the Atari.

The club to know in New Zealand is called the Tariland Computer Club, based in Auckland City, and we have members and contacts throughout New Zealand. The club, like any club is dedicated to help and support for those who want it. It also gives a central public organisation (we are incorporated) that Atari people can contact at any time. We count on members support to exist, and to that end I would encourage and invite anyone on Atari to join our club, it helps not only yourself, but also the group as a whole. We are not as Mr Shepherd infers " fanatical" but rather follow a common sense approach of support and interest in this platform... and we have found that this thinking is appreciated by members.

I am certainly not going to tolerate one sad man in Wellington portray to the world via the net that New Zealand is Atari dead. Nothing could be further from the truth. Mr Shepherd fails to see that we are not interested in if he is right or wrong in his rantings... we are here for the positive purpose of endorsement. And he should take the direct message that he is not welcome at all in these areas. But I understand his mind-twist, he enjoys it, and gets his thrills this way. I am not interested for him to "check out our club to see how good it is, we all completely understand that he has a silly hidden agenda .

So, the various people round the world reading this, I would like you to know that we are able to get information and hardware here in New Zealand regarding things Atari, we go to wherever it is to get it. Period.

And there are still people here who are quite keen that their machines will keep going for the forseeable future and are willing to take steps in order for that to happen.

I invite you to comment here regarding the messages in this thread and particularly welcome positive feedback.
I don't think we have to put up with this man, Mr Shepherd, and I think it is about time every one gave him a hearty farewell...

cheers

-Brian Becroft (mbecroft@iconz.co.nz) Keeping ATARI ALIVE in New Zealand!--President Tariland Computer Club Auckland New Zealand--------------------

Thomas Trauth (trauth@paul.rutgers.edu) wrote:
: Hey Sinflop, it looks like Apple management has pulled
: a "Tramiel"! I read today in c.s.mac.adv that Apple told
: MacWeek that they have given up trying to increase the Mac's
: market share and will instead concentrate on its (small)
: installed base.

Without reading the entire article and all of the facts that aren't in
that one, sole article, your theory is correct. In reality, though, the
gist of Apple's movement is to improve their current machines'
capabilities in order to make them more competitive with the Mac clones
which are now shipping from some vendors.

In a limited scope, you're right: Apple is NOT trying to increase _their_
market share. The Mac clones should take care of that aspect. Instead,
Apple will be concentrating on the MacOS and competing directly with
Microsoft Windoze -- which is where the real money is.

: What a great thing to announce right after the excitement
: generated by the release of the first 604-based Macs! What
: a great message to send to potential Mac cloners and IS
: managers everywhere: Apple intends on keeping the Mac a
: niche product and has given up on its efforts to make it
: more mainstream!

I could point out the arrogance and obvious error in this statement, but
I think you've said enough.

: If this announcement represents Apple's true corporate
: strategy, they have essentially raised the white flag and bowed
: down to Emperor Bill and his Evil Empire. The war is over and
: Microsoft has won!

So you think. The *FACT* (something you missed) of the matter is that
Apple is moving to compete DIRECTLY with Microsoft. No bowing, no surrender.

: So, Petey, remember next time you put down Atari as a "dead"
: company, don't forget that your beloved Apple will soon be equally
: dead.

Right, sure, uh-huh. Whatever. Blah, blah, blah.

: LONG LIVE THE JAGUAR!!

Isn't Jaguar dead yet?

rappleye@felix.kodak.com (TPFKARDF) writes:

:> :Copland is really aimed at CHRP, any pre-CHRP Copland releases should
:> :really be considered like evaluating Win95 beta on a 486SX. Apple is
:> :betting the farm on a CHRP/Copland configuration which will (hopefully) be
:> :as radical a step forward as the original MAC. Personally I see CHRP as
:> :being more of a help to MS than Apple...many Macophiles would consider
:> :switching if windows was as easy to configure and support as a mac
:> :(something that CHRP could well provide).
:>
:> Then why the heck is Apple supporting CHRP?
:>
:Easy...it's the right thing to do. HW/OS independence is a concept almost
:as radical as the original mac. Combine CHRP with the open doc/OLE
:initiatives and you have a rewritten scenario for end user computing...a
:scenario where the user and his/her needs are are predominant rather than
:HW, OS, or apps. Apple is betting that it can compete with Gates and
:company even when the shorcomings of current and future wintel offerings
:are mitigated by CHRP. While I'm not sure they can pull it off, they're
:certainly showing some balls for trying.

I'm still not sure what Apple will get out of CHRP. They certainly
have to do something because if they just stand pat they will go the
way of C= by the end of the century; but is CHRP the answer? Not only
will CHRP let Mac users run Windows (well Win NT at least; I haven't
heard of any planned PPC versions of Win9-whatever yet) it will really
open up the Mac clone market. Cheap clones (assuming they materialize)
will almost certainly expand the Mac-compatible user base, but it will
also very likely cut into Apple's Mac sales. This will only be good
for Apple if they can make more money from selling System 8 than they
can from selling Macs. (Of course their is a good chance that they can;
after, MS doesn't seem to do that badly).

One more question. One of the main reasons why the Mac is easier to
use and configure than the PC is because of the high level of integration
resulting from the fact that one company, Apple, made both the hardware
and the system software. If Apple becomes a system-software-only company,
how will they be able to maintain this high level of integrations?

:It's also a "good thing" to have more than one major player in the consumer
:computer (HW/OS) market

True.

:> And as for Mac clones, from what I've heard there won't be any normal ones
:> (meaning ones meant to be desktop computers rather than servers) until

:> next year. I doubt Mac clones will have a significant impact on the
:> computer market until late next year.

:Agree 100% on that one...I really expected the clones to attack the
:high-volume low-end (680X0) first...cheap, expandable entry level systems.
: Oh well, like you say, next year (maybe)...kinda sounds like Atari doesn't
:it?

Yes. And like Microsoft (wasn't Windows "95" supposed to be out in
the Fall of '94?).

:peace,
:paul

I remember the same argument when Wintel 3.0 arrived on the scene in 1990.
System 7 did arrive later and Apple held onto their market. As for Wintel 95,
Microsoft will hold onto the converted with lots of hardware upgrading. Tons
of Pentiums will sell, thats for sure. The UNI library as part of the new 4th
floor addition and complete remodelling will add 40 Pentiums and PowerMacs.
Ten will replace public terminals and be used as WWW use.

<Much sintrash deleted>

You make things sound so cheery for Apple Petey, but the reality is that Apple has ended its offensive and switched to defensive mode; for the next year they will concentrate on preventing further defections from their installed base rather than trying to convert more people to the Macintosh format

Why this sudden shift? Because of Windows95. Knowing Microsoft, Win95 won't be out until late this year, but that's still a LONG time before Apple will be able to get Copland out the door. This is a big blow for Apple because Win95 is in many ways technically superior to System 7. Win95 has preemptive multitasking; System 7 doesn't. Win95 has built-in Web support; System 7 doesn't. Etc. Even worse, MS has succeeded in making Win95 a least superficially Mac-like. Of course the Mac will still be much easier to use, but try to tell that to Joe Schmoe who only gives each computer a one-minute tryout at CompUSA (especially after he sees that 90% of the software in that store is for PCs). Win95 is tempting bait, especially considering the PCs huge software advantage. Apple has to do something (like its planned multi-million-dollar anti-Win95 marketing campaign) to keep its installed base from biting.

If Apple could get Copland out soon after Win95's release things would be different because Copland (if it terms out to be like Apple says it will) will be so much better than Win95 that everyone, including Joe Schmoe, will be able to see the difference. Also, since Copland will also have preemptive multitasking (for the most part) and all Win95's other technical advances, MS wouldn't be able to brag about how much better Win95 is than Copland (at least from a technical standpoint). In short, if Apple could get Copland out right after MS released Win95, it would be a different ball game because Apple would be in a much stronger position; they would be able to continue their offensive. But since they are in a relatively weak position, they can't.

Apple, due to Copland's lateness, has suffered a setback.
Admit it Sinflop!

A defensive policy in what way? Record revenues and earnings to be announced
next week. Plus PowerComputing, Radius and IBM will also grow the base.

> Even ATARI (yes, little Atari) is focusing on expanding the user base
> of the Jaguar. But Apple seems to be content with what it has and is now
> focusing on keeping that niche, which is an interesting future indicator.

Thats funny. Atari growing a userbase? ROTFLMAO!! The problem with Atari is
that the Tramiels think that their part of the market industry. I bet the big
III when developing mareting/competitive strategies do not list Atari in their
plans.

As for Apple, its a ver big niche like 1995 fiscal sales of $11 billion.

>
>>Plus Apple will roll out a 100 million plus marketing camapaign through

Well, this sounds ogical for sure, but someone posted something to the
effect that this was wrong and gave a reason for it, I don't have that
post anymore, but that's what I was referring to when I said "the other
guy" said you were wrong. It sounded to me like he knew more about the
details than you or I.

> of the OS to disk.

I didn't say "no way" I said that on windows systems this is typicaly not
done, or at least not as much as on other OS's. I was in part basing this
on other comments onthis thread again, by other people seemingly more up
on the details than you or I, (notice I include *you* in there each time),
that this was in fact true. I have no quarell with the possibility that
some parts of the OS are swapped out although I am sure that there are
large parts that "never" are. I too have seen the GDI modules loading in
Win95 and noticed that they are in about 30 segments. (You can just look
at the boot logs in the root to see this).

> I mean, after all, this is not a bad thing; in a low
> memory situation, overall performance can actually be improved if less
> used parts of the OS are swapped out.

True, this could be one of the ways in which Win95 improves performance
and low memory operations, I am not sure of the exact manner in which the
GDI was loaded in Win3.1, it doesn't have a boot log per se and I never
used heapwalker on it to find out.
>
> Take a look at the Windows heap with HeapWalker and you'll see that the
> GDI code is broken into about 30 different segments, each of 10K or less.

> Win 3.1, and that it won't run as well in 4 MB as Win 3.1. That's all

> I've said. I've never said that Win '95 doesn't work in less than 8 MB.

Well I don't like to be so picky about this, but he gave me a real hard time and was really tenacious about his points, so I will be too. intentionaly or not, he did directly imply that this was the case. He said, in the same sentece, or words to this effect, (obviously I don't have the quote in front of me right now), that "the footprint was bigger" and that "8MB was not enough...(to load Win95)" these kind of statements, given in the context they were led me to believe that was what he was claiming, and after replying back and forth several times, he never confirmed or denied what he meant by it. All he had to do was say, "I didn't mean that", but he didn't. In fact his details got sketchier as time went by. I took this to mean that he actualy meant it when he said it and then subsequently was backing off. In any case, I don't care anymore.

> >I won't get into the detail of your other

Well, what I agreed that this was *likely* that Win95 had a bigger footprint, what I have been trying to get across also is that I don't know for sure and *neither* do you. By calling what you posted a "theory" I was trying to be accurrate, not insulting. It's a good theory, but it makes assumptions that cannot be backed up right now, that's why I said in absence of those facts that I would go with the tests and the experience of the users, which is that Win95 runs as fast or faster in 4MB as Win3.1.

> That means Win '95 uses
> more RAM. That means that, running the same apps on the same system, Win
> '95 is always going have a larger of ratio of VM being used to the amount
> of physical RAM than Win 3.1. That translates into reduced performance.
> No way around it.

But there is a "way around it", there *is* increased performanc ein all areas of Win95 especially in I/O and cacheing, as well as video performance. The printing subsystem is also very, very much faster. All of these things can affect not only the subjective impressions of speed to the end user, but also make the system physicaly faster. Perhaps,

(although I am far from conceding this point), *everything* you say about the size of the footprint and the swapping is true, but *still* the system is as fast or faster due to these improvements.

The reason I have trouble with your theory (not about swap-files per se but about why Win95 may not be faster than Win3.1), is that if the footprint is really over 4MB in size or even close to that, then you start swapping even just to run the OS, and running Word on top of that would be horrendous. it would perform like a sick dog. I know this is in part your point, but I have to go back to tests and experience, which states quite the opposite from this scenario. People, many people, running Win95 with applications like Word running, have stated that it seems as fast or faster to them than Win3.1, which if your scenario was true, simply could not be the case. The same goes for any test I have seen in magazines as to loading times and performance of basic application operations. The times come out virtualy the same as those for Win3.1.

Hello,

I am upgrading to a new system and would
appreciate some advice. Below is a list
of the components and if possible could
someone look them over and tell me if they
think it is a good overall system and if
each piece has good drivers.

Having saved for years, I want to get the
best possible system that will be easily
upgradable to a P6 or other chips in the
future.

Here are the components:

Component Brand Price

MOTHERBOARD Mylex MGPT 256cache $279

SPEED Pentium 75 $289

CASE MidTower 250 watt $109

MEMORY 32 mgs (2x32/70) $895

HARD DRIVE SCSI 2 (1.4 mg) $245

SOUND CARD SoundBlaster 16 Value $94.95

MODEM Prometheius 14.4 (Voice) $99.00

VIDEO CARD Miro 22sd(2mg PCI) $149.00

CONTROLLER Adaptec AHA 2940w $347.95

MONITOR NEC 15 inch monitor $436.00

If anyone can advise me as to components better, please let me know.

Terry

What ?

> The above quote was in direct response, (and
>quotes directly from) your previous post, wherein you said that it has a
>"larger footprint" and that "8 Megs is not enough".

>These were two
>separate statements, but put together in such a way as to imply a
>linkage.

The two comments were separate as you acknowledge. If you wish to link
them -- your act not mine -- then you have a new statement that I did
not make. If you want to agrue with yourself -- go ahead.

>That is what I replied to you about in the first place and that
>is what we havve been "discussing" ever since.

So you have been discussing something I did not say. You are
discussing something you decided to do-- knowing it was inaccurate both
technically and not what I said.

>Now you are trying to make
>out like this is some "theory" of mine, when (as I have said all along), I
>was trying to get som efactual repsone out of you due to the fact that you
>seemed to be impying this in the first place. All you have done is make
>snide comments back so far.

I am discussing a comment with someone who BOTH made it and then decided
to agrue against it.

>Again, I don't know where you get "my theory" that office needs 12 megs
>and would not load in 4. You are realy fond of putting words and

>"theories" into other peoples mouths are'nt you?

You made the link between two separate comments and so You are the one
who is making up stuff. You disagree with yourself and are made at me.

>Oops, have to answer the rest later, my Hydrogen powered Van-Pool awaits!!!

I'm glad you use alternative fuels.

>pushing for Win95 development won't run under Win95.

It would be funny, but it's not, because you are wrong. Visual C++ 2.0 was
written for NT and runs just fine under Win95, I use it all the time.

>It wouldn't surprise me if MS put code into Win95 to make sure
>Borland C++ 4.5 doesn't run.

It's unlikely that anything could surprise someone who is as certain of
everything as you are, even though you are pretty well dead wrong on all
counts. It's called "having blinders on", or being "close-minded". By not
letting reality in the door, one never has to worry about surprises or any
kind.

It is sad though that many people will read crap like you post and actualy
believe it, so your particular delusions are not totaly harmless.

Semantics aside, the truth is that on my 8 MB system with VM turned off, when I boot up the Program Manager says I have 4.5 MB left. That means that Windows, including things like the Program Manager and DOS and drivers and video buffers, *are* eating up 3.5 MB. Right?

Now, it's true that some of that 3.5 MB *is* discardable; if you use a utility like HeapWalker, you'll see that some of all modules in Windows are marked discardable. That means that, in low memory situations, Windows can delete those items, and they can be loaded from disk again when needed. This is essentially a more primitive form of VM used for read-only resources like code. These discardable resources are, in part, what allow Win 3.1 to run in 2 MB, but reloading these resources when needed requires the same performance hit as VM.

>Some OS's like
>copland it is rumoured, can swap out parts of the actual OS, but in
>general, the "core" OS has to load into real memory and remain there.
>with Windows 3.1 it can do this in 2MB, but it isn't pretty.

Can you cite a reference that indicates that none of the Win 3.1 or Win '95 OS is swapped out when needed? There's no reason that high-level parts of the OS, such as the GDI and USER modules, can't be swapped out just as easily as any application's code. I'm not sure I understand why you think there's no way that Win 3.1 and Win '95 could be swapping parts of the OS to disk. I mean, after all, this is not a bad thing; in a low memory situation, overall performance can actually be improved if less used parts of the OS are swapped out.

Take a look at the Windows heap with HeapWalker and you'll see that the GDI code is broken into about 30 different segments, each of 10K or less.

These are all marked "discardable". This means that these parts of Windows can get discarded in low memory situations, and reloaded when needed. In fact, the *only* reason to break the GDI into thirty, discrete pieces is to make it so that parts can be swapped out as needed. If it was all going to stay in RAM permanently and never be swapped, the GDI could just as easily be one, big, monolithic module.

Certainly, there *has* to be a core that stays permanently in RAM and never gets swapped, but that core could just be 64K or so.

>The whole argument I was having here was over Joseph
>Coughlans implications that there was a significant rprefomance drop with
>Win95 in the same meory configurations, and that Win95 just "doesn't work"
>in less than 8MB. I know you also agree with these statements to some
>degree but they are wrong.

Nothing in Coughlan's posts indicate the he said Win '95 wouldn't work in 8 MB; he's just saying what everyone else is, that Win '95 is bigger than Win 3.1, and that it won't run as well in 4 MB as Win 3.1. That's all I've said. I've never said that Win '95 doesn't work in less than 8 MB.

>I won't get into the detail of your other

>parts of each system that has to be swapped, I would put forward that it
>is all too hypothetical to be taken seriously.

Jeremy, this is not an elaborate theory, it is basic virtual memory. The greater the ratio of virtual memory being used to the amount of physical RAM, the more swapping you are going to get. Period. There is no way around it. You admit yourself that Win '95 has a bigger "footprint" than Win 3.1, regardless of how footprint is defined. That means Win '95 uses more RAM. That means that, running the same apps on the same system, Win '95 is always going have a larger of ratio of VM being used to the amount of physical RAM than Win 3.1. That translates into reduced performance. No way around it.

BTW, I'm still waiting for some Win '95 users to perform the same test I detailed in my earlier post. Take a fairly clean Win '95 installation, turn off virtual memory, and reboot (you're going to need at least 8 MB of physical RAM to do this properly). Do whatever you do in Win '95 to check the amount of free RAM available. Unless Microsoft is somehow fudging this number, the result is going to be that at least 3.5 MB are being used. Report the results to us.

This will give us an idea of how much RAM Win '95 wants to use when *not* in a low memory sitation. In a low memory situation, at least part of

this will be discardable or swapped out, so this test doesn't indicate that Win '95 can't run in less than that. However, it will give us a rough estimate of how much more swapping will occur in Win '95 than Win 3.1.

"Best possible system" and "upgradable to a P6" do not go in the same
system. The best possible personal computer system available today
is a either a PS850 from IBM or a PowerMac from Apple.

(IMHO, of course)

|| Component Brand Price
||
|| MOTHERBOARD Mylex MGPT 256cache $279
||
|| SPEED Pentium 75 $289

Go with the P90 (or better, P100), the P75 is only slighty faster than a 486/100. By the end of the year, look for Intel to stop selling anything slower than 90mhz.
|
|| CASE MidTower 250 watt $109
||
|| MEMORY 32 mgs (2x32/70) $895
||
|| HARD DRIVE SCSI 2 (1.4 mg) $245

Where did you find something this big, this cheap? Are you sure it's FAST SCSI-II? On a system of this caliber, you really want something with <10ms access and the highest possible transfer rate.

|| SOUND CARD SoundBlaster 16 Value $94.95
||
|| MODEM Prometheius 14.4 (Voice) $99.00

Go 28.8 and make it external. I've seen USR Sportster 28.8
with FAX for under $200. It's worth it.

|| VIDEO CARD Miro 22sd(2mg PCI) $149.00
||
|| CONTROLLER Adaptec AHA 2940w $347.95

Do you REALLY need a wide adapter? Unless this will be some
sort of server, it's doubtfull you will be able to generate
enough I/O to see the difference between wide and narrow.
I've seen OEM 2940's for under $200, spend the $150 diff on
my other suggestions...

|| MONITOR NEC 15 inch monitor $436.00

Linux came from overseas.

One issue this thread has danced around without addressing is that of ownership of intellectual property. That is the only reason gates has gotten the vast majority of his wealth. Such ownership is a relatively recent invention, and hasn't even been acknowledged in a large part of the world. It could go away with the strokes of a few pens. Most everyone following these threads should remember that. With the ubiquitization of computing the high priesthood of programming will shrink into the background, leaving only those who are internally motivated to do what they are doing, rather than doing it for money. And maybe a bunch of exploited drudges.

In response to RS :

I was responding to your "what is the point in a Club that is some 400 miles from me" remark. You seemed to naysay it just because it was "400 miles" away.

(By the way, NZ is a metric country. We changed over during 1973-1979 by gradually phasing out imperial, and phasing in metric. The distance from Auckland City to Wellington is 650 kilometres).

This is just a small-minded attitude that you were showing. "It's not in my neighbourhood, so it isn't worthwhile". At the time I wrote my followup, that was how I interpreted your comment. You were saying "it isn't local, so what use is it?". One can be a member (out-of-town, overseas, intergalactic...) of things, you know. Being a five minute walk from home may be handy, but rejecting it just because it is "400 miles" away is just dumb. Insular thinking such as this is not very productive.

Yes, I do know about Genie. I just didn't know it was accessible from NZ, (as someone else has posted here). Last time i looked, the nearest access point was Sydney in NZ's West Island.

In hindsight, I will admit that I had worded my followup badly - I gave you an opportunity to downgrade me and Atari Users in general.

In my defence, I must add the following : At the time I wrote my followup, however, I had just spent 20 or so hours non-stop staring at computer virus code (the author of which is due a fate worse than death, after I've found them and given them a good "shake by the throat"), which I had successfully disassembled, and gradually neutralising. Fully neutering the virus took a few hours longer. Dealing with the output of a deranged mind

for extended periods causes a somewhat skewed interpretation of things.

With regards to the "dumb" remark : From your poor spelling (USE A SPELL CHECKER WHEN YOU POST!), to lack of grammar (your incorrect use of homonyms is very telling), it would appear that you have a higher dumbness quotient than I have.

Have you ever written any code for the ST? Distributed software patches for the ST range (including TT and Falcon) which you have written yourself, and are used every day by many people? Implemented variable priority (selectable by the user at-any-time) into software? Written "uncrashable" multitasking software? Got around anti-debugging code in a piece of music software to find out _why_ it misbehaved when run on a TT?

I have done each of these things in the last three months. Each of these tasks require intelligence, mental dexterity and the ability to see a problem through to it's conclusion.

Do these traits define me as being "dumb"? I think not.

In fact, have you EVER said one good thing about the Atari?

Is your continual bad-mouthing of the Atari simply a way to ease your publicly-stated decision to buy a PoliticallyCorrect? Do you have to follow the trend of others by bad-mouthing something.

Or does it stem from the fact that, in a post of yours about a week ago, you mentioned you had a "520ST" (which, as you hadn't elaborated, must be assumed that it is an unexpanded half-megabyte model?) and would rather spend NZ$2000 buying a PoliticallyCorrect instead of NZ$350 to expand it to eight times that amount of RAM (8 times one-half megabyte equals four megabytes).

Or have you suddenly reached a point in your life where you feel totally inadequate, and must bolster up your pitiful ego by dismissing everyone else as inferior to you (...because they own Ataris and are therefore inferior to big, strong you)?

Perhaps you just like posting trolls, and seeing the responses come in?

Remember the old saying, "If you have nothing good to say, then say nothing". When responding to things Atari in a non-advocacy area, try to remember this.

So, I challenge you to say nothing bad about the Atari or it's users for one month.

sinclap2954@cobra.uni.edu writes:

:> You make things sound so cheery for Apple Petey, but the reality
:> is that Apple has ended its offensive and switched to defensive
:> mode; for the next year they will concentrate on preventing
:> further defections from their installed base rather than trying
:> to convert more people to the Macintosh format

:In what way has Apple changed to defensive mode?

Read the above paragraph.

:> Why this sudden shift? Because of Windows95. Knowing Microsoft,
:> Win95 won't be out until late this year, but that's still a LONG
:> time before Apple will be able to get Copland out the door. This
:> is a big blow for Apple because Win95 is in many ways technically
:> superior to System 7. Win95 has preemptive multitasking; System 7
:> doesn't. Win95 has built-in Web support; System 7 doesn't. Etc.
:> Even worse, MS has succeeded in making Win95 a least superficially
:> Mac-like. Of course the Mac will still be much easier to use, but
:> try to tell that to Joe Schmoe who only gives each computer a one-
:> minute tryout at CompUSA (especially after he sees that 90% of the
:> software in that store is for PCs). Win95 is tempting bait,
:> especially considering the PCs huge software advantage. Apple has
:> to do something (like its planned multi-million-dollar anti-Win95
:> marketing campaign) to keep its installed base from biting.

:I remember the same argument when Wintel 3.0 arrived on the scene in 1990.
:System 7 did arrive later and Apple held onto their market. As for Wintel 95,
:Microsoft will hold onto the converted with lots of hardware upgrading. Tons
:of Pentiums will sell, thats for sure. The UNI library as part of the new 4th
:floor addition and complete remodelling will add 40 Pentiums and PowerMacs.
:Ten will replace public terminals and be used as WWW use.

Win95 is much more serious threat to Apple than Win3.0 was because 95,
unlike 3.0, is Mac-like enough to trick people into thinking that a
Windows PC is as easy to use as a Mac. That, combined with Windows
huge software advantage over the Mac, will convince several people
(including current Mac users) to switch to the PC. I'm sure that Win3.0
was able to fool many people as well, but Win95 will MUCH more effective
at that because, on the surface, it is so similar to the Mac.

:> If Apple could get Copland out soon after Win95's release things
:> would be different because Copland (if it terms out to be like
:> Apple says it will) will be so much better than Win95 that everyone,
:> including Joe Schmoe, will be able to see the difference. Also,

:> since Copland will also have preemptive multitasking (for the most
:> part) and all Win95's other technical advances, MS wouldn't be able
:> to brag about how much better Win95 is than Copland (at least from
:> a technical standpoint). In short, if Apple could get Copland out
:> right after MS released Win95, it would be a different ball game
:> because Apple would be in a much stronger position; they would be
:> able to continue their offensive. But since they are in a relatively
:> weak position, they can't.

:Apple will get Copland out. New urgency, thats for sure. However you have to
:go back to 1990 time frame. Deja vu all over again.

When? 1997? And the urgency is much greater here because 1) While Win3.0
merely caught up with System 7 (to an extent), Win95 actually passes it in
some ways; and 2) Most of System 7 is emulated, including THE ENTIRE FILE
SYSTEM! Apple has done a good job in mitigating the effects of this, but
you can't deny that all this emulation (especially of the file system) hurts
performance.

:> Apple, due to Copland's lateness, has suffered a setback.
:> Admit it Sinflop!

:In unit sales? 28% revenue gain in the last recent quarter.? The setback is
:Coplands lateness not Apple's fundlementals..

That's now. I'd like to see Apple's revenue figures after Win95 comes out.

: Thats funny. Atari growing a userbase? ROTFLMAO!! The problem with Atari is
: that the Tramiels think that their part of the market industry. I bet the big
: III when developing mareting/competitive strategies do not list Atari in their
: plans.

Check some stock reports. Why did mighty Nintendo flame the
little Jaguar and 3DO in their ads last Christmas? Because they're
afraid. How is it that Sony reps, Sega reps, Nintendo reps and 3DO reps
know all about the insides of the Jaguar? Get real Sinclap. They may not
be terribly afraid of Atari (with the exception of the 3DO), but they
sure don't turn a blind eye.

: >>Plus Apple will roll out a 100 million plus marketing camapaign through
: >>December attacking Wintel 95 head on.

Oooh ... ahh. Apple is a small player compared to the Intel machines.

: Gates has done that before, but can't touch Apple's $11 billion plus niche, GET
: OVER IT! Win95 will have little affect on Apple's niche, GET OVER IT! Plus
: Macs are preloaded with software as well, GET OVER IT!

He can't touch Apple's niche? More like Apple can't touch his
dominance.

: ROTHLMAO!!!

Stupidity. For every one store selling a Mac around here, there
are at least 20 selling PC's.

: What a $11 billion plus niche! Have you told school districts that WINTEL 95
: has won.

Take a tally of all the PC sales last year. You'll be laughed out
of the room if you think Apple has anything close to the market the clone
makers have.

: Standard. The Mac is the K-12, higher ed, publishing and home/small business
: standard...

It's getting killed in the business world Pete. Most people own
clones at home, *NOT* Macs because that's what they use at work. At my
school and most other Universities in Canada, the PC is blowing away the
Mac in terms of units in use.

: > Peter Sinclair... not in the same age as the Neanderthal, but equally
: > dumb.

Hahahahahahaha!

: Who needs 64 bit titles? Thats why I love my Jag....

1) You don't own a Jaguar. 2) You've never seen one. 3) You've
never seen or played any of the games. GIVE IT UP!

> and the system software. If Apple becomes a system-software-only company,
> how will they be able to maintain this high level of integrations?

You're too easy Tom...CHRP will provide the HW consistency that will maintain the ease of integration. This same consistency will make the port of Win 95 to CHRP inevitable...it will be an easy platform to write for. Actually Win 95 for CHRP is not very important...NT with the 95 GUI is probably a better choice than Win 95 anyway.

In case you haven't noticed, Apple has not done a very good job of meeting market demand for it's products...it seems like popular systems are backordered until the replacements are announced. Having a bunch of cloners introducing new systems all the time will help maintain the excitement (and help Apple sell lots of OSes).

It's funny how "Atari" computing has grown to include things like MagicMac and Gemulator...I wonder if anybody will be crazy enough to do TOS for CHRP?

steveg@phantom.com (Steve G.) writes:

:Thomas Trauth (trauth@paul.rutgers.edu) wrote:
:: Hey Sinflop, it looks like Apple management has pulled
:: a "Tramiel"! I read today in c.s.mac.adv that Apple told
:: MacWeek that they have given up trying to increase the Mac's
:: market share and will instead concentrate on its (small)
:: installed base.

:Without reading the entire article and all of the facts that aren't in
:that one, sole article, your theory is correct. In reality, though, the
:gist of Apple's movement is to improve their current machines'
:capabilities in order to make them more competitive with the Mac clones
:which are now shipping from some vendors.

:In a limited scope, you're right: Apple is NOT trying to increase _their_
:market share. The Mac clones should take care of that aspect. Instead,
:Apple will be concentrating on the MacOS and competing directly with
:Microsoft Windoze -- which is where the real money is.

There is one small problem with your theory: all the Mac clones
shipped to date are aimed at the server market! Normal Mac clones
(ones Joe Schmoe could pick up at CompUSA) won't be out for another
year and it is therefore doubtful that Mac clones will have much of
an impact on the computer market until late '96. In other words,
the Mac clones won't increase the market share of the Mac-compatible
computers until late next year! Until then it is up to Apple to
increase the Mac's market share, and they have decided to not try to
do that.

:: What a great thing to announce right after the excitement
:: generated by the release of the first 604-based Macs! What
:: a great message to send to potential Mac cloners and IS
:: managers everywhere: Apple intends on keeping the Mac a
:: niche product and has given up on its efforts to make it
:: more mainstream!

:I could point out the arrogance and obvious error in this statement, but
:I think you've said enough.

What is this obvious error? I don't see it.

:: If this announcement represents Apple's true corporate
:: strategy, they have essentially raised the white flag and bowed
:: down to Emperor Bill and his Evil Empire. The war is over and
:: Microsoft has won!

:So you think. The *FACT* (something you missed) of the matter is that
:Apple is moving to compete DIRECTLY with Microsoft. No bowing, no surrender.

Why? What chance would Apple have against MS in a straight OS war?
Don't you think that Windows' huge market share relative to that of
the MacOS would give MS a rather overwhelming advantage? I know that
the MacOS (at least after Copland comes out) will be technically superior
and more user-friendly than Win95. But Win95's interface is superficially
Mac-like enough to convince most people that Win95 is as easy to use
as the MacOS. And it is applications, not technical superiority, that
sell OSs (otherwise we would all be using NT right now); and the Windows
software library is MUCH bigger than the Mac one. Face it: In an OS
fight MS would knock out Apple in the first round.

:: So, Petey, remember next time you put down Atari as a "dead"
:: company, don't forget that your beloved Apple will soon be equally
:: dead.

:Right, sure, uh-huh. Whatever. Blah, blah, blah.

You may not be laughing five years from now...

> 55 games more than the Jaguar seems more acceptable than 245 more games,
> don't you think?

Actually, I don't think the absolute numbers of games is very meaningful..

I think the *perception* of the relative numbers is VERY important.

Going only by my own personal experience, the 3DO *wall section* at the Electronics Boutique store near me is FAR more "impressive" than the pile of Jaguar game boxes on a nearby SHELF.

It gives the impression that there are FAR more games (doesn't matter HOW many more it is, it's just MORE) for the 3DO system than for the Jaguar.

I think most game buyers know that the number of games actually available for a system is much lower than the "total" number of games out... there must be many HUNDREDS of games for the SNES or Genesis, but most stores probably don't stock more than 50 or so different titles at one time.

But just the ratio of space filled by the available games between the 3DO and the Jaguar tells a lot.. without even needing to know the totals.

But in an different sense, the absolute totals DO tell a rather chilling story... in just about the same amount of time, software developers have actually written 300 titles for the 3DO... while everyone on the planet working on Jaguar titles have only come up with 25.

It doesn't matter whether you can actually walk into a store and BUY all 300 at once.. (you can't do that for the Jaguar either). It gives a rather stark comparison of the "faith" that developers have in the two systems.

> Yes, though the 3DO has been in *MASS* market for longer

If you talk with Don Thomas at Atari, you'll discover that the Atari Jaguar is STILL not on the "Mass Market"... Atari is marketing the Jaguar "regionally"...

A year and a half after its introduction.

That may be a big factor in the reason why there are 300 titles for the 3DO and only 25 for the Jaguar, don't you think..?

> No, but did any of those pre-date the Altair?

No. The Altair was a computer without any applications.

It was a pocket calculator without any numbers to crunch, a game machine without any games.

It was a creature with a life of its own, completely divested of utilitarian reasons for being. It calculated no spreadsheets, sorted no databases, and printed no corporate bottom lines.

It was a concept, an idea, perhaps a dream, embodied in silicon, plastic and steel.

The Altair, the IMSAI, Southwest Technical Products, the Digital Group..

These were djinni... creatures of an underworld, dreamworld.. summoned here by dreamers. Their potential stunned the ones who dreamed, and who could see where they could go.

You had to be there...

>over and let someone steal him/her blind by trying to socialise their
>product/s. This has been the standard way to take control of industries,
>fortunes, etc. throughout recent history.

Why are you bringing socialism into the picture? A change in
intellectual property rights is not tantamount to socialism. Let's say
the law simply changed to say that software patents & copyrights expire in 7
years with no renewals. Such a revision would have nothing to do with
public ownership of the means of production. (Which is what socialism is...)
It would permit individuals to capitalize off of their ideas, but it
would prevent companies from locking up ideas indefinitely.

In my opinion, our strict enforcement of the laws as they now stand
(isn't the Xor cursor patented, fer cryin out loud?) will stifle American
innovation far far more than Bill Gates, who is more the symptom than the
disease. What will happen to American software startups who find that
they need a legal team to put out a product, as compared to Indian and
Chinese programmers who can, with impunity ignore our country's intel.
prop. laws?

(I really shouldn't reply to this, since this entire thread of articles
is being spammed all over to inappropriate newsgroups...)

> Actually, it *is* evolutionary, in a sense -- the computer business
> has been shrinking its electronic switches ever since the 1950's
> -- and has been going to greater and greater component densities.

The development of the microprocessor is FAR more "revolutionary" than
just a continuation of the shrinking of physical size of components.

Moving from vacuum tubes to transistors to ICs is an evolutionary process,
very true...

But the development of the microprocessor ushered in a *different way*
of making computers.

The fact that the resulting computers are smaller is only an incidental
side-effect.

You could just as easily implement the functions of a microprocessor
with vacuum tubes, and it STILL would be *different* from the computers
which preceeded it.

The "micro" in microprocessor doesn't refer only to its size, it referrs to
the way the processing is implemented.

Distributed processing computers like mainframes have been getting smaller
and smaller all the time in an evolutionary process... the company I work
for used to run DEC-10 which took up two large computer rooms. We replaced
dozens of multi-CPU mainframes with six MUCH smaller machines which do the
same amount of work (actually they're far faster). They take up maybe
10 feet of space.. about the same as ONE of the DEC-10 CPUs they replaced.

The thing is, the new computers, while implemented in LSI silicon and new
high density PC boards, are STILL distributed processing systems, just like
the predecessors of the microprocessor. This gives them their speed and
power, but also their complexity and cost.

The microprocessor was revolutionary because it was a new, different way
of approaching the concept of a computer. It was slower and less powerful
than the existing computers, but it was simpler and far less expensive.

"A computer on a chip" made it possible to build computers for EVERYONE to
use... if we'd been stuck with the "evolution" of the old style of computers,
the world would be a far different place today.

(We wouldn't even have pocket calculators.. that was what the 4004, the first "true" microprocessor was developed for.)

In that respect, the development of the microprocessor ushered in a "revolution" in the computer industry.

> Revolution in "computing" != revolution in "computers". The popularization
> of the computer did not create a revolution in the computer itself, only in
> society's thought.

You've got it backwards.

The popularization of the computer was CAUSED by the development of the
microprocessor CPU.

The development of the microprocessor made possible a revolution in computing
that made it possible for computers to REACH society as a whole.

I still maintain that an "evolutionary" downsizing of an IBM 360 would NEVER
have made computers available to society in the way that microprocessors did.

The revolutionary concept of the microprocessor CPU created a revolution in
both the computer AND in society.

> You've got this nasty little habit of trying to take effects and make them
> the cause,

Umm.. no, you seem to have a nasty habit of getting it backwards.

The microprocessor CPU was not developed because computers became popular..

It was the other way around.

The effect was a revolution in the computer industry, and the cause was the
development of a revolutionary concept called the microprocessor CPU.

The comparison with the evolution of the bicycle wheel doesn't wash...

Going from wooden wheels to metal wheels with rubber on them would be like
going from a vacuum tube UniVac to an LSI Systems Concepts SC-40...

Both are distributed processing systems, and there's nothing "revolutionary"
about the change in form.. the SC-40 is smaller and faster, but essentially
the same as the UniVac, or more specifically, the DEC-10 which it
replaces.

The change from distributed processing computers to the microprocessor is
more akin to a change from bicycles with ANY kind of wheel to personal
jetpack transportation units. A totally different, "revolutionary" way
of acheiving the same ends.

The bicycle wheel could be incrementally improved forever, and it would
still be a bicycle wheel. The microprocessor CPU was a different,

revolutionary departure, from the old way of pedalling.

> Alright, then what do you have to say about the Amiga? It came out in 1984
> or '85 (don't remember which) and it had the "distrubted processing"
> concept with its specialized graphics chips and I think even sound chips
> too.

Indeed.. the Amiga represents a return to the concept of distributed
processing to achieve something of the speed and power that was lost
in going to the microprocessor CPU.

BUT...

The Amiga computer is designed around the Motorola M68000 microprocessor.

All the graphics and sound processing COULD have been done by the CPU
chip. The designers of the Amiga included "copper" chips (Co-processors)
to help offload some of the computing load from the CPU... just like the
early computer designs used.

The point is.. there probably would NOT have BEEN an Amiga computer if not
for the revolution brought about by the microprocessor CPU chip.

By the time the Amiga was designed, the concept of individuals owning a
"computer" had become accepted by society as a whole... due entirely to
the development of the microprocessor CPU chip.

Before the microprocessor, computers were something the size of a boxcar,
with lots of whirring tape drives and needing an air-conditioned
environment to run. Only businesses and governments had "computers".

AFTER the development of the microprocessor CPU chip, ANYONE could afford
a "computer"... and eventually the Amiga became one of them.

NOW that the "computer industry" has grown to its current size and level
of development, it's possible to begin adding back in some of the concepts
from the early computers by using technology developed AFTER the invention
of the CPU chip.

Even the Atari Jaguar game system uses some pretty advanced "distributed
processing".. but without the revolution in the computer industry caused
by the development of the microprocessor CPU, it would not exist today.

So, you equate a list of the positive things Atari-wise that I have done as "self pity drivel"?

What positive things Atari-wise have you done in the last three months? (Other than criticise the Atari hardware, it's users, people who differ in opinion to yours...)

Also, you have failed to give a reason for your continued harping on the "Atari is crud" ideology.

The hardware meets my needs, those of my acquaintances, numerous Atarians worldwide, and will continue doing so for quite a while.

If it meets the needs of so many people, then the notion that it is "crud" is false.

>>So, I challenge you to say nothing bad about the Atari or it's users for
>>one month.

> Another Atari Bigot that thinks he is above every one else, gee I do hope
> you can sleep at nights, or is the Bed no Big enough for you Head....

(Bigot: n. a person convinced of the rightness of one particular creed, opinion, practice)

I am not an "Atari Bigot". If a particular application is best suited to another platform, I will say so. That is not the mark of a bigot. For extreme scientific applications I will point people to the workstation market, pre-press to the Macintosh, games playing to the PC.

I wasn't trying to say that I was "above every one else". That was YOUR interpretation. I was trying to prove firstly that your crack about "dumbness being a requirement of Atari Users" was a complete and utter lie. You have yet to prove that your blanket statement about _all_ Atarians being "dumb". I am living proof to the contrary. Likewise NASA researchers, numerous musicians, and some Taligent staff, who, let it be known, all use Ataris on a regular basis. I seriously doubt they would be classed as "dumb".

Actually, I do not sleep nights. I use that time to initiate supplicants into the wonderful world of the undead. :)

> I also challenge you to stop being a Big head and a Bigot...!!!

Yes, the size of my cranial structure is a little larger than normal, but I do not brag about it. (Contrary to popular misconception, it's really the size of the cranium that drives the ladies wild - yippeee!)

For someone who likes pointing the finger and saying "Bigot", _YOU_ are showing all the classic signs of being one.

From: fluke@MCS.COM
Message-ID: <3u7s3r$9d3@Mercury.mcs.com>
Source record: 11830

I will save you the boredom of reading a very long and tedious message by getting right to the point:
The problem with Atari is only partly the companys fault. The main reason for the demise of many of Atari's great ideas has been the users. Think about this. This is sad when a user comes down to asking for places to get pirated software for his st, and you know what, it's people like him who cause this in the first place. If Atari users would start thinking more about the future of their computer and their company, and less about bashing other systems, maybe they could get something done.
Part of the problem lies in the programmers. There are to few people who can really code on this boxes. Those of them who can code nicely, never get repaid for what they do.

Well, these are my two bits. Any responces are welcome, as I figure that I am ready to deal with them.

If you read this message I congradulate you on the fact that you realize something is not right with Atari. And the a percentage of Atari users.

: Still 300 titles..

How many of the 3DO titles are made with Macromedia's Director? If they would make a player for the Jaguar (and if Atari finally does get the CD ROM drive out there, then the Jag would instantly have extra titles. Does anybody know if Macromedia is working on a Jaguar player, or maybe if they have licensed Atari to make one?

>> SPEED Pentium 75 $289

That's nonsense. The P75 was designed for notebooks, and somehow escaped to the desktop. It will run the PCI bus at 25 MHz, which is only 75% of what you should get.

>> CASE MidTower 250 watt $109

No need to go overboard with the PS. 200 is fine (harddisks are small these days :-)

>> HARD DRIVE SCSI 2 (1.4 mg) $245

I think you'll have to dump a bit more money for this --- you want Wide SCSI, so don't try to save on the drive itself.

>> VIDEO CARD Miro 22sd(2mg PCI) $149.00

Maybe go with the SV --- though with a 15" monitor, the SD should be fine, too.

It was neither the cheapest nor the most expensive. The cheapest of
the really functional PCs (ie not based on the 6502 line) was the
Atari ST; the Amiga was more expensive, but not dramatically so. Both
boxes were considerably less expensive than IBM PC compatibles or the
Mac line.

Boy, that brings back memories. I got one of the very first Atari
ST's when it arrived in St. Louis. What a box! I even got the
developer box of goodies, which included a schematic, and
proceeded to add another 512K RAM. Whoooo doggies, it was heaven
for awhile.

Apple will go by the way of C= at the end of the century? Why end of the
century? Why not now when Wintel 95 is around the corner? Make up your mind..

CHRP will be sort of public domain. Any manufacturer can clone the design.
So Apple does not have to support time and money to clone firms like they have
to do now. Thats Why Apple has been picky in choosing when licensing to clone
firms because of a small staff in the licensing division. Apple does not want
allow a Packard Bell type firm to be in the Mac clone business.

And may switch PC users to the Mac as well. I was informed on Friday, that additional Powermacs will be added to the UNI Library. The huge Windows software is 16/32 bit and not 32 bit. Wintel users will have to wait for 32 bit ones to take advantage of Wintel 95.

I remember that Wintel 3 advocates said that it blows away System 6 and that Apple is a gonner. Apple will prosper with new technology like the new 3d engine that is native on the PowerMacs.

Not true. PowerComputing is selling to the public and so far so good.
PowerComputing will also be an OEM supplier to other firms interested in
cloning. IBM will manufacture Radius clones. Apple will increase their share
in the markets that they serve.

Apple has a new plant under construction in Sacramento Calif. The Cork Ireland
Plant will be or has been expanded already. Apple Europe also has signed up a
Korean firm to produce 800,000 Macs.

>
> The cloners will help, but probably not for another year and a half.

PowerComputing will be releasing a bread and butter PowerMac in September.
Similar to the 6100 line and may have nubus/pci slots. Price will be around
$1300 with software bundle. This model is pictured in the August issue of

MacUser.

We discussed the method that Apple Computer uses to purchase parts, manufacture computers and distribute them in buisness last week. It seems that Apple tries to keep inventory as low as possible and uses a 'just in time' delivery system. This really limits their ability to respond strategically to a changing market place and forces their marketting people to accurately predict demand. A failure to predict demand will force Apple to order new parts, then build the computer and then distribute it since they will not have very many in stock. Other companies start a production run and accumulate stock in warehouses since they know that eventually x units will be sold. That allows them to start a new production run if the units sell better than expected. Or something like that :)

Perhaps. Convince me. What is the cost of 180-200 hours per month? (For the months of April, May and June that is about how long I have been online if my comms software logbook is accurate). Are they like C$, where, a few years back, the charging clock would stop whilst you were uploading? And how is the access to the net? (oops, that wont be available for another 18-24 months...)

> But you do need a credit card to use it....

.. and pay usurious finance rates for the privilege. Nah. I'd rather stick to my net provider, which allows me to pay in cash as I go. I currently have a nice healthy credit balance there, and support is A1+.

> Plus in only runs at 2400 but could soon be up to 9600....

(Great for 'in', but what about Genie? :-))

Wow! 2400 baud! I _am_ impressed! Guess I'll have to sell my 28800 baud modem and upgrade. (Hey, anyone! Want to swap your 2400 baud muscle-modem for my 28800 slow-coach?)

Seriously, though, the only thing I would be interested in was the "Dateline Atari" - which is often available via other sources not long afterwards. (Unless Atari has discontinued it's participation in that as well).

> than the existing computers, but it was simpler and far less expensive.

I think Bob that you are trying to say that the revolutionary aspect of
the microprocessor was the move from distributed systems with all their
channel architectures and i/o controllers and what have you, to th idea
of "one chip does all".

I have to disagree. ;> The earliest computers were essentially single-
user, single-task machines with one or two input devices, one or two
output devices, and various levels of "storage". The cabinet contained
circuit boards which went to make up Arithmetic/Logic unit, sequencer,
memory controller, i/o controllers, ... all those blocks which you see
in the diagram of the latest microprocessor, only you didn't need an
electron microscope to see them.

Then computers began to move from being arcane devices in research
laboratories to being multi-access devices. The number of users --
people -- connected to each computer grew explosively, faster than
the increases in CPU speed. So more and more ways were found to
shift processing away from the CPU. At the same time, CPUs began
to shrink, because they had to use less components and less imter-
connections and less power if they were to become faster, not to
mention cheaper. There were also other markets for miniaturised
electronics -- aviation, military, industrial, even domestic. Clive
Sinclair designed a radio the size of a matchbox. At a certain
point it became possible to manufacture a 4-bit one-chip CPU which
could compete with specialised chips in pocket calculators and in
process controllers.

Inevitably a point was reached at which it was possible -- *just*
possible -- to build a computer for yourself, as a hobby. Inevitably
it was a very crude machine, just like those early computers. The
CPU did everything, even scanning the keyboard to see if a key had
been depressed, even pushing bits out of the serial port one by one.
(BTW I'm generalising here, I don't know the specifics of the Altair).

This situation didn't last for long: as soon as i/o chips and keyboard
scanners and the like became cheap enough to incorporate, then they
started to show up in designs: leaving the CPU to do Real Processing ...
todays micro's are stuffed with controllers for floppies, for hard
discs, for the keyboard, for the screen ... blitters and DSP chips
come and go, now they are making MPEG controllers ...

> "A computer on a chip" made it possible to build computers for EVERYONE to
> use... if we'd been stuck with the "evolution" of the old style of computers,
> the world would be a far different place today.

The price for making "computer"s available to everybody was that they were
very primitive computers, and we had to go through all that evolution
all over again. Todays network server has multiple CPUs, intelligent
controllers, in short all the paraphernalia of the old mainframes.
Even (hopefully) a real grown-up operating system ...

(VMS is dead. Long live Windows NT!)

> (We wouldn't even have pocket calculators.. that was what the 4004, the
> first "true" microprocessor was developed for.)

> In that respect, the development of the microprocessor ushered in a
> "revolution" in the computer industry.

Indeed, but pushing work back onto the CPU was maybe not the most
revolutionary of ideas.

Group memory in this industry is really short. Remember, Bill covered
his bets by placing a side-bet on unix. That lost, his main bet won.
Big. So now that unix is finally taking off (in the commercial arena),
he's betting that he can still make a killing in the proprietary arena
where it interfaces with the commercial arena (translation: Win 95
sells big as a client). The side bet now is that the low end market is
inappropriately covered by unix, so NT will cover that. If the side bet
loses, so what? And if it wins, mayber the next big bet is to merge NT
& 95. Mo' money mo' money mo' money.

Nobody remembers all the "open" standards that have gone away. Even DEC
gave up on the OSF name, it was the only one selling that.

I think it will take quite a long time for Bill to fall - he make not
even be at his peak yet. Barring any changes in the law he brings down
on all our heads. Some pretty bad standards may give a black eye to all
"open" standards.

It's more complicated than that. I'd agree that NT on the workstation
can be viewed as a hedge -- but not against UNIX. UNIX can't survive
on the desktop as-is, and even improved versions (like NeXTStep)
have fallen flat in the marketplace.

What they're hedging on is the Intel architecture. As far back as
1988 Gates was thinking that Intel might lose the market to RISC in
the near future. It hasn't, but MIPS looked promising for awhile and
the PPC battle is only just getting started. It could still happen,
and if it does Microsoft wants to be sure they'll be there.

Of course NT is more than just a hedge against the failure of Intel,
but that sure was one of the things Gates was worried about.

sinclap2954@cobra.uni.edu writes:

:Apple will go by the way of C= at the end of the century? Why end of the
:century? Why not now when Wintel 95 is around the corner? Make up your mind..

I never said Win95 would put Apple out of business immediately. Cause
Apple severe damage, yes, but kill them right away, no.

:CHRP will be sort of public domain. Any manufacturer can clone the design.
:So Apple does not have to support time and money to clone firms like they have
:to do now. Thats Why Apple has been picky in choosing when licensing to clone
:firms because of a small staff in the licensing division. Apple does not want
:allow a Packard Bell type firm to be in the Mac clone business.

They will have to allow el cheapo cloners like PB in eventually if they
really want the Mac user base to expand. There are just too many people
out there who look at the price tag and nothing else.

:>
:> One more question. One of the main reasons why the Mac is easier to
:> use and configure than the PC is because of the high level of integration
:> resulting from the fact that one company, Apple, made both the hardware
:> and the system software. If Apple becomes a system-software-only company,
:> how will they be able to maintain this high level of integrations?
:>

:Through CHRP platform..

I should probably really ask this on c.s.m.h, where there are people who
actually know what they're talking about. But what the heck, I'll ask
you anyway: How will CHRP maintain this high level of integration. I
have yet to see a detailed document on CHRP.

I don't know why I am bothering to respond to this utter garbage....
Greg, I really don't think you can blame piracy for the demise of
the ST. Piracy is very prevalent on the IBM. _Every_ IBM user I
know pirates. I am not saying that clone users are more dishonest
than users of other platforms, though. People copy music onto
blank tapes; people will copy disks. They don't see the damage
that it causes. All software companies are huge like M$, right?
I also don't think Atari users flame other platforms more than
the others. Have you looked at the other messeges in this group?
Check rec.games.video.atari and brace yourself for many flames from
3DO fans. I can't understand why people are so anti-Atari like
Sinclair. Everything is all-or-nothing with some people. I
recently commented that I was impressed with the quaility of
networking software on the Mac and got a snide remark from Sinclair
about how he thought I despised Macs. When have I said that?
Okay, I am rambling. Back to the point- don't blame the users.
The Atari community has some of the nicest people in it that you
could ever hope to meet. So don't the other platforms. In the end
it is the companies that make products successes or failures. My
support for Atari didn't turn the ST into the dominant platform and
never could. -scott tirrell

In comp.sys.next.advocacy (<3u7o69$79h$2@mhadf.production.compuserve.com>),BobR (76702.1466@CompuServe.COM) wrote:
| > Revolution in "computing" != revolution in "computers". The popularization
| > of the computer did not create a revolution in the computer itself, only in
| > society's thought.

| You've got it backwards.

| The popularization of the computer was CAUSED by the development of the
| microprocessor CPU.

That's what I said. :) I had to read it twice to make sure... :)
The popularization of the computer didn't create the revolution in
computer hardware. Your original statement implied that comparison.

| The development of the microprocessor made possible a revolution in computing
| that made it possible for computers to REACH society as a whole.

Yes. But that does not make it a revolution in hardware, and that's
the point. The evolutionary development of the microprocessor, a
trend that followed a logical path of downsizing and integration aided
by the technological revolution of the IC created a revolution in
society.

Evolutionary design, revolutionary IC technology, revolutionary change
in society. None of which equal the others. :)

| The revolutionary concept of the microprocessor CPU created a revolution in
| both the computer AND in society.

And that's where we disagree. :) Revolutionary elements that changed
in computer design didn't create a revolutionary microprocessor; the
micro was really, truly just a downsized and more integrated "big guy".

| Umm.. no, you seem to have a nasty habit of getting it backwards.

...back, and to the left...

| The microprocessor CPU was not developed because computers became popular..
| It was the other way around.

That was my point... see above.

| The effect was a revolution in the computer industry, and the cause was the
| development of a revolutionary concept called the microprocessor CPU.

And I disagree completely. The computer industry's revolution came
from two sources: Revolutionary change in hardware, the IC, enabled
them to build systems that created a revolutionary change in the way
people thought about computers; those two things caused a revolution
in the computer industry; when people changed their minds about
computers, the computer industry reinvented itself to follow.

| The comparison with the evolution of the bicycle wheel doesn't wash...

I disagree.

| Both are distributed processing systems, and there's nothing "revolutionary"
| about the change in form.. the SC-40 is smaller and faster, but essentially
| the same as the UniVac, or more specifically, the DEC-10 which it
| replaces.

What you're pointing at is the difference in integration levels. What
I'm saying is that the difference in integration levels is an
evolutionary change brought about by the new abilities granted from
the revolutionary change in technology, specifically, IC.

You know, this is -really- silly. As I said originally, this is
really a POV thing. Had Livy and Tacitus been writing this history,
you can bet your ass they'd be doing the same thing.

| The change from distributed processing computers to the microprocessor is
| more akin to a change from bicycles with ANY kind of wheel to personal
| jetpack transportation units. A totally different, "revolutionary" way
| of acheiving the same ends.

Oh, good grief, total disagreement. Right now, I want one of those
people who believes that there -is- no such thing as a revolutionary
change to come forward and smack us both over the head just to shut it
up. :)

| The bicycle wheel could be incrementally improved forever, and it would
| still be a bicycle wheel. The microprocessor CPU was a different,
| revolutionary departure, from the old way of pedalling.

Taking the pedals off of the wheel and using a pulley/chain system to
connect a crankshaft to the pedal was an evolutionary change in the
bicycle. THAT is the correct analogy, in my humblest of opinions, to
the *evolution* of the CPU into the microprocessor era.

So there. Pffft. :)

Three things:

1. It's just "HRP" (the "common" went a long time ago)
2. The design belongs to Motorola IBM and Apple, and is NOT public domain
If you want it, you LICENCE it (and pay for it)...
3. trim your quotes.

Taken directly from Apple's web site (http://www.apple.com):

<begin quote>

A LETTER FROM DAN EILERS

Thursday, July 13, 1995

copyright 1995, Apple Computer, Inc.

APPLE IS COMMITTED TO GAINING MARKET SHARE MORE THAN EVER BEFORE

I had to be peeled off the ceiling when I read the front page article in the July 10 issues of MacWEEK by Jon Swartz and Robert Hess entitled "Apple: Market share no longer top priority" (MacWEEK, July 10, pages 1 and 92). The headline is entirely misleading and just plain wrong and I want to take this opportunity to go on the record about our our market share strategy to clear up any confusion this article may have caused.

Of course it is true that we want to sell "more products, etc. to our installed base. But it is just as true that we want to capture more customers for Apple in our chosen segments (education, both higher ed and K-12, home, small business, entertainment, large business and government). That's why I've got market share graphs hanging on my wall--to keep close track of our market share movements by segment. I talk about our plans to gain share aggressively within these segments in everything I do, from employee meetings to speeches to presentations to interviews.

Our share position in each clearly delineated market segment will determine our future. We are aiming for leading share in each area in which we compete. That is the whole point of our strategy. Let me be very clear here. If we grow share in these fast growing core market segments, we will grow share overall and that remains our goal.

Additionally, we are looking to licensees to be a source of new customers for our platform. But clearly we are looking to entice new customers to Apple products and services.

Finally, while we do intend to be much more aggressive in the way we tell our story, and how we offer a better solution to customers, it is not our intention to "slam" the competition... but merely to assure that our points of value difference are more clear to our customers.

Dan Eilers
Senior Vice President, Worldwide Marketing and Customer Solutions

Apple Computer, Inc.

> they *would* accumulate a decent-sized stock of Macs so that when users
> ordered them they would be able to fill their orders.

This "just in time" approach is exactly the way Atari Corp. operates too.

They've had chronic problems with spot shortages of equipment for years, from not having enough TOS ROMs to keep up with demand to having a world-wide shortage of monochrome monitors just as they started pushing the "Atari Direct to Press" DTP systems.

Guess that means they weren't "sincere" about being a computer company, eh..?

It's funny that when it's Atari Corp being discussed, all the above ideas are Good Things. When it's Apple being discussed, they're not sincere..

: > the Mac clones won't increase the market share of the Mac-compatible
: > computers until late next year! Until then it is up to Apple to
: > increase the Mac's market share, and they have decided to not try to
: > do that.

Thanks for proving to me how little you actually know about this. As of this writing, there are at least five (4) Mac clones shipping. Power Computing, DayStar, Radius, and PowerUser (a MacWarehouse "house brand"). All of them are less expensive - sometimes considerably so - than comparably equipped Apple Macs. They are shipping now; people are buying them, thus increasing the MacOS market share.

And once again, sinceyou missed it the first time around (I'm amazed at how many times things need to be repeated in this newsgroup before they're acknowledged) I'll say it again: Apple is _NOT_ trying to increase _THEIR_ market share _IN MAC HARDWARE_. They are content to let the clone manufacturers take care of getting the boxes into homes and businesses. Apple's new goal is to promote the MacOS; this is a strategy which has served Microsoft very well. Remember, Apple is one of the top three computer manufacturers in the world, topped only by (I think) Compaq and IBM itself. Since they're already producing more hardware than the vast majority of individual computer manufacturers, they're moving to where the greater money is - the OS.

: > What is this obvious error? I don't see it.

The error is the false assumption that Apple is "abandoning ship". It's just not true. They're just moving their efforts from producing the hardware AND the operating system, to leveling off their hardware efforts and focusing more on the OS which is, as stated, where the greater money is. Regardless of Apple's involvement, hardware power roughly doubles every 1.5-2 years. All Apple needs to do is ride that wave of power at each turn with new and better OS's -- just like Microsoft, but better. :-)

: > Why? What chance would Apple have against MS in a straight OS war?

The MacOS is demonstratably the better OS in nearly every respect. The main reason why Wintel machines are more predominant is pretty simple: the hardware, up until recently, was considerably cheaper. When fully configured 386 systems were running ~$1500-$2500, comparable Macintosh machines were about double that (at least). Today, the

price/performance ratio is about even with one glaring exception: Macintosh systems are _ALWAYS_ easier to install, configure, learn, and use than comparable Wintel machines. And don't even bother with the "Windows 95" argument; yes, the new OS will undoubtedly be better than Windows 3, but since Wintel machines don't (and most likely won't ever) offer the same level of hardware/software integration, a Windows 95 machine will NEVER match the benefits of the MacOS machine.

: > Don't you think that Windows' huge market share relative to that of
: > the MacOS would give MS a rather overwhelming advantage? I know that

A definite advantage, yes, but certainly not an overwhelming one. Keep in mind that despite the nearly 15-to-1 ration of PCs to Macs, the Macintosh, and Apple, continues to remain a powerful, viable alternative to PC computing. And that's in TODAY'S community. The Macintosh, with the new 604 processor, has a definitive leap over Wintel machines in terms of power, and it already has the lead in ease of use. Copland will be PowerPC native long before Windows will be, and the computer manufacturing industry is moving inevitably to the CHRP standard. When that standard becomes widespread, the MacOS will have a considerable advantage over Windows; it will already have a long-established PowerPC native OS with hundreds of PPC native titles. It will take some time before similar claims can be made about Wintel machines; heck, the Pentium has been out for over a year, and how many programs have been optimized for Pentium speeds? Not a lot in the larger scope of things, while nearly every modern Mac program is PPC native. By the time Windows and its applications are made PPC native, the MacOS and its native apps will have already established a formidable beachhead.

I'm NOT saying that the MacOS, and Apple, will topple Windows and Microsoft. However, I don't think it unreasnable to say that Microsoft will be facing much tougher challenges in the next few years. We're effectively starting the next generation of computing; RISC-based machines utilizing a common hardware standard. Apple has at least a year's-plus lead on this facet, people are getting tired of MS's bloatware (and Gates in general), hardware prices are just about equal, and the Mac platform is stronger than ever.

"Utter Garbage"? Hmm. I feel as though that what I wrote is at least a little higher than "Utter Garbage." You stated that every computer has lots of piracy, and yes, this is right, but other computer platforms also have a much larger bases for their software support. And, you can not honestly disagree withme on that fact that the decent programs that are out there do not recieve the credit which they deserve.
It is very difficult to explain my feelings on this topic. I live in a house with every computer platform... From DEC's PDP8 to Apple to IBM to Amiga. And I feel that support for other systems is far superior to Atari, especialy Amiga. And, I also stand by my statement that a percentage of Atari users _are_ to blame for some of the problems with the company. Yes, Indeed, some of the nicest people I have ever met are involved with Atari, so why should we feel obligated to insult and put down other system platforms as they do us? Especialy if we know it to be wrong. What I am against is not neccesarily the bashing of other systems, but of bashing other systems in a completely mindless manner. Such drivel as simple a message of, "your system sucks(insert obscenity here)" really gets me mad. I feel that if someone is going to insult a system, they should have some knowledge of what they are talking about. Obviously, whoever you quoted as saying that 3D0 is better than the Jaguar obviously doesn't have his information correct. Yes, indeed 3D0 is better than the Jag on some fronts (I must point out lack of software support on the Jaguar), but the Jaguar is better than 3D0 in other areas.
There I end this message. I still stand by all my beliefs and thoughts that I posted in my initial message.

: : > more acceptable than 245 more games, don't you think?

: : Still 300 titles..

: How many of the 3DO titles are made with Macromedia's Director? If
: they would make a player for the Jaguar (and if Atari finally does get
: the CD ROM drive out there, then the Jag would instantly have extra
: titles. Does anybody know if Macromedia is working on a Jaguar
: player, or maybe if they have licensed Atari to make one?

: Scott

You are right. Quite a few 3DO 'Edutainment' titles are basically
authored on MacroMedia's Director using a Mac or PC and ported to run on the
Director 3dO player. This is one reason why the 3DO suffers from terminal
shovelware affliction. Still, I think Atari should get MacroMedia to
release a Jag Player version. Shovelware is better than no ware.

sinclap2954@cobra.uni.edu writes:

Once again, Sinclair's ignorance and arrogance is spotted.

>And may switch PC users to the Mac as well. I was informed on Friday, that
>additional Powermacs will be added to the UNI Library. The huge Windows
>software is 16/32 bit and not 32 bit. Wintel users will have to wait for 32
>bit ones to take advantage of Wintel 95.

Win95 runs many 16 bit applications at noticeably faster speeds than its
DOS-based counterpart. Trust me on this one, Sinflop; I am using
it right now.

>I remember that Wintel 3 advocates said that it blows away System 6 and that
>Apple is a gonner. Apple will prosper with new technology like the new 3d
>engine that is native on the PowerMacs.

Why don't you look at the whole picture. While Apple has "held onto"
their niche, what has happened to the PC market over the past 3 years?
It has mushroomed exponentially.

>Wintel 95 will be like Wintel 3. Will be difficult to install and configure
>despite what Microsoft saids. We have no plans to switch to Wintel 95 on our
>office servers and desktops.

YOU IGNORANT FOOL! Have you even used Win95?! Or are you speaking
out of your butt again? Win95 is quite easy to install, though it
takes very long. High density disk-based Win95 comes on 17 install
disks. If you have a CDROM, you've lucked out, you can install it
from one CD. I imagine the final product may take a few more/less
disks depending on what is streamlined and added.

And Win95 is NOT difficult to configure. In fact, it can detect most
of the hardware on your system correctly. There are currently a
few bugs with this, though, some of the less common hardware products
may not be properly configured.

:>I haven't heard of any such dongle, though knowing MS I wouldn't be
:>surprised if it had one. Also, knowing MS, I wouldn't be surprised
:>if Win"95" wasn't released until February. But that is still *way*
:>before Copland will see the light of day.

:Win95 WILL ship in August. I have a copy of it here on the PC on my desk.
:It has quite a few minor glitches, but nothing serious that would
:force Microsoft to delay it any longer. And it is a big step over

I have heard that also. I guess my prediction that it wouldn't be
released until 11:59 on New Years Eve (the last possible time they can
ship it without looking really stupid for calling it Win95) won't
come to pass. Nor will my roommate's more conservative Oct./Nov.
prediction. Unfortunately, it looks like MS will ship Win95 in August.
Unless, that is, the DOJ decides to sue MS for including MS Network in
it. If the DOJ decides to go after MS over that, then MS, even though
they have made a MSN-less version of Win95 in preparation for that
possibility, would probably have to delay the release of Win95 so they
could recall the offending MSN version of Win95 and replace it with
the MSN-less one. But that delay will only be three weeks at the most.
I hate to say it, but it looks like Win95 is indeed here.

And (to all the Peteys of the world) Win95, if it's anything like what
I've heard it is (slick new interface, fewer resource problems, etc.),
will do much more damage to Apple than Win3.x did. Just watch.

:>And as for Mac clones, from what I've heard there won't be any normal ones
:>(meaning ones meant to be desktop computers rather than servers) until
:>next year. I doubt Mac clones will have a significant impact on the
:>computer market until late next year.

:I agree.

Especially since it appears that you will only be able to get these machines
through mail-order. Most computer stores barely even carry Apple's Macs.
Can you imagine how reluctant they'd be to carry some Brand X Mac, especially
since it's still up in the air right now whether or not the Mac clone market
will mushroom (especially considering the fact that the Apple user base is
relatively small and seems to be very loyal to Apple and very wary of other
computer companies).

BTW does the Win95 beta really have a "registration wizard" that checks
to see whether or not you have pirated MS software and reports you to
Emperor Bill if you do?

In 1985 (I think), I got a "deal" by going in with some friends and we all
paid about $1600 (with tax) for our 1000's with some extra ram. Marble
Madness is still one of my faves. It still costs about $1600 to get an
average PC (if any PC could be called average). Hmmmm. Maybe this
capitalist pricing thing is based on what consumers can afford rather
than intrinsic value.

Has it? I seem to remember they both came out about the same time.
Although initially Atari targetted only one area (was it california) you
could soon buy Jaguars anywhere (or not buy them as the case has been).

>
>: Is that supposed to make Jaguar owners feel better..?
>
> No, but it is making a point that Sinclap is really overdoing things.

At the end of the day, not only has the quantity of jag games been poor,
but also the quality. Only Doom and Tempest 2000 stand out as being playable
and indicitive of what the Jaguar can do. 3DO has many more games, but also
a higher number of _good_ games. The fact that 3DO can sell as many consoles
as Atari at *more than twice the price* doesn't bode well for the Jaguars
future against the likes of the mouth-watering PSX.

Ugh, in a way, it does. If I remember correctly, Win95 asks you
for your registration # at the beginning of the installation.
If you enter an "invalid" registration id, Win95 aborts the installation
and your system locks up. I didn't install it first hand, though, but
I remember talking to a co-worker about this.

Source record: 11883
Cross-posted to: rec.games.video.atari,comp.sys.atari.advocacy

: Has it? I seem to remember they both came out about the same time.

In Canada, I was seeing 3DO's in November of 1993. I didn't see
Jaguars on store shelves until the following May.

: Although initially Atari targetted only one area (was it california) you
: could soon buy Jaguars anywhere (or not buy them as the case has been).

The Jag was initially available in two markets (San Fransisco
and New York I believe). In 1993, Atari shipped all of 17,000 units. When
the following summer came, the Jag had started to ship nationally.

: At the end of the day, not only has the quantity of jag games been poor,
: but also the quality. Only Doom and Tempest 2000 stand out as being playable
: and indicitive of what the Jaguar can do.

And Aliens Vs. Predator. And Iron Soldier. And Super Burnout. And
Hoverstrike. And Wolfenstein 3-D. Most other Jag games are pretty good,
although they have been overplayed (ie. Syndicate, Theme Park). There are
only a few real duds ... Trevur McFurr, Club Drive, Checkered Flag,
Double Dragon V.

> >computer market until late next year.
>
> I agree.
Excuse me, how can you possibly agree with such an erroneous statement?
The conclusion
perhaps, but not the assertion about the type of computers Mac-clone
makers are producing.
Power Computing's offerings right now are desktop computers - not servers.
The other cloners like Daystar, Radius, and PowerUser all provide or
intend to produce
desktop computers _not_ servers.
Some are targetted to niche high value markets (graphics and the like),
none are servers.
No doubt it will take time for the Mac Clone industry to pick up steam.

Perhaps Mr Trauth is confusing Mac Clones with the PPC offerings from
Motorola, IBM
and FirePower which can run systems other than MacOS. Or perhaps Mr
Trauth is,
simply, confused.
Perhaps Mr Trauth should read more, and listen to fewer rumors: which are then
accepted as gospel by others.

has anyone ever used a 19" monitor on a falcon?
is there any 19" that support both color and mono?
please let me know..

does a Moniterm work on a falcon?
can the falcon be modified to make it work?

how about the atari tt194 (i think this is the model number of this)
anyone know how much they go for and if they will work?

thank you

J Lopez (jlopez@panix.com) wrote:
[stuff deleted...]
: Software innovation proceeds apace in this country, as it does in the
: rest of the world. In fact, having an established standard of
: programming makes it easier to write a better-mousetrap program and know
: that 50 million folks will be able to use it if wanted. Why is there
: Delphi for Windows, and not for OS/2, Unix or Linux???

Standard of programming?? Under any version of UNIX if I write an
application program, I can port it to any other machine (no matter
what architechture) running UNIX with little (or most likely *NO*)
changes. I find it difficult to understand what you are refering to
when you say a "standard of programming". The plain and simple
reason that there is Delphi available for Windows and not OS/2, Unix
or Linux is that it was probably more profitable for the company to
write it for Windoze since Windoze has a larger installed base of
users.

: I am no big fan of Bill Gates or MS, but this idea that other countries
: will outpace us due to his stifling influence is without merit. Probably
: the country with the greatest per capita software innovation is Israel.
: Yet you don't see Israeli software overrunning US markets.

No other countries will ever outpace us. This however is IN SPITE OF
his influence. Look how long MS-DOG has been around!!! Since the
freakin' dark ages!!! Bill is only just now trying to get rid of it
(e.g. Windoze '95).

I'm sorry, but I whole heartedly agree with the previous
respondant...BillGates *IS* an evil man and must be stopped. His
business tactics are unfair, and his skills do not merit his position. In
my opinion this makes him a very dangerous man.

Later,

Well that is the trouble really. Nothing worth quoting...

Mr Shepherd says so much in these areas which is ill advised and wrong, and he knows that there are areas especially designed for his mindset.

I think it should be said that Mr Shepherd is no Authority on the subjects he espouses and in fact he has an agenda all his own and quite anti Atari. He hates it when I say, with Authority that there are parts, clubs, books etc where Atari information is readily obtainable.

Our club in New Zealand is living proof that Mr Shepherd is a liar. He is more akin to a racehorse with blinkers on. Our Club Membership has increased especially over the past 18 months. The machines are reliable and are likely to be around for a few more years yet.

Mr Shepherd, these areas are for people who own and use Atari machines and are seeking advice etc. You are not interested in the "truth are you". You seem to have such a fanatical love/hate relationship with this brand, we wonder if it is a personal kind of "streaking" which you have no control over.

Please re-read the post. Gregory was talking about MS-DOS, which he so
humorously referred to as MS-DOG. Note that MS-DOG has very little
visual or imaginable oral similarity to "Win," "Windows," or "Win3.x."
You must be a spectacularly forgetful person not to notice what you
said conflicts with what he actually posted.

As far as the evolutionary point goes, Microsoft seems to try to make
a completely different animal out of Windows every time it updates it.
On the other hand, most of the upgrades to OS/2 have been incremental
in scope. And take a look at UNIX. It has been around since the dark
ages, and retains much of its baggage from those years, but it is still
here, and has more going for it than any OS written by a company that
takes 11 years to even begin steps to eliminate old technology under-
pinnings of its latest wonder toy. Microsoft seems to realize this, I
think, and that is why it rewrites Windows from scratch every so often.
But there it misses the point. Incremental upgrades are the solution;
don't just redo the whole thing and hope that the bugs don't crop up
because it's new code. Don't throw out the baby with the bathwater;
keep the code that works and fix the code that doesn't.

Nope..In Q3, 1994 Apple reported a one time gain which inflated their earnings.
Actualy their earnings are up over 70% in Q3, 1995.

Gavan,
How about trying the games out for yourself? People on rec.games.
video.atari seem to like Super Burnout and AvP. I, personally, loved
AvP. And, if you are to blindly believe every mag then you'd have
to agree that Cybermorph is a 97% game, right? Or do you only listen
to advise that satisfies your peculiar anti-Atari attitude.
BTW, I find it strange that you dislike the Jag when it is getting
good Amiga ports like Pinball Fantasies and Cannon Fodder. Isn't
the Amiga the best game machine around?

As much as I hate to say it, Sinclap is very right about the
Falcon being overpriced in the US. The machine is simply too expensive
and has limited amounts of software and power to justify the cost when
clones that are more powerful sell for less.

It would be really great if C-Lab would release a Falcon at a low
cost ... an 030 machine with Atari-Works and a small hard drive for say
... $350! I think the Falcon would be a fun hackers machine, but at it's
current high price, it just ain't worth it.

Wall ST was expecting Apple to report 90 cents a share in their earnings.
Apple came in at 84 cents per share and thats why they got hammered. Their
gross margins are way up though. Also, there is component shortages and could
barely keep up with demand. Apple said that shortages will ease in the present
Q4. Apple's sales were up to $2.5 billion from 2.1 billion. Apple is presently
building up their inventory for the new PCI macs that will debut on Aug. 7 at
MacWorld-Boston.

Well I congratulate you Kim on a good effort. Mr Shepherd has this little fantasy that he is up with the play on the issues he drivels on about, but sadly, he cannot get out of his fantasy. I have seen this happen to people, and it is even sadder that we around the world are witnessing his mind go stranger and more paranoid. There are no characteristics of upright and intelligent discussion in his comments these days. But a little contestable talk would not go amiss in these areas would it!

> >BTW does the Win95 beta really have a "registration wizard" that checks

I think the question was in reference to the somewhat "unique" method of registration that Windows 95 comes with.

What happens is that if you have a modem on your system, Win95 asks if you want to "online register" your system. If you say yes, it will dial the MicroSoft Network (MSN) and process your Windows 95 registration via modem... but... it will also transmit a bunch of data about your system, including what applications you have installed under Windows, as well as your CONFIG.SYS and AUTOEXEC.BAT files.

MicroSoft says this information will be placed in a database, and used to help you if you need to call for assistance with Windows 95.

Users are just a bit nervous about it...

I agree with Scott Tirrell when he says that the demise of the ST
is due mainly to the lack of support from Atari.
Atari did it first with the 8-bit then they went from dominating
the 16-bit market to absolute zero market share.
As for flaming .... Atari users have had to put up with a lack of
support for years so probably are more prone to "violent"
outbursts...don't use that as a valid excuse to get off an
assault charge!...no flaming to my mail box please.
I was lucky and passed the ST by...from an 8-bit to an AMIGA and
now a PC system...the machines were (and still are) good, the
users are (generally) great people...just the company sucks!

Oh brother. Being a shrewd businessperson is not evil. Being a multi-billionaire is not evil. Taking advantage of your market position to increase your wealth is not evil. Being an arrogant SOB is not evil. Being a good marketer is not evil. Being enthusiastic about one's vision of the future and communicating that enthusiasm to others (regardless of how unrealistic it may ultimately be) is not evil.

Initiating physical force against another person is evil. The seizure of property earned through free trade is evil.

Let's get our categories straight before we start marking moral judgements, okay?

>i think Backus won it .... don't remember what year... but it had something to> do with
>functional languages ...

I don't remember what Backus's citation was for, but I doubt that it was
about anything functional since his most celebrated creation was Fortran,
something not at all functional. I believe that it was for Fortran and
related work being one of the earliest compilable high level languages.

The ACM's own description of the Turing Award reads:

"ACM's most prestigious technical award is accompanied
by a prize of $25,000. It is given to an individual
selected for contributions of a technical nature made
to the computing community. The contributions should be
of lasting and major technical importance to the computer
field. Financial support for the ACM A.M. Turing Award
is provided by AT&T."

Its recipients are listed below. Most of them are pretty recognizable names...
Wilkes for early work in computer architecture, Hamming for work in coding
theory and communications, Minsky for AI, Wilkinson for numerical analysis,
McCarthy for AI, Dijkstra for a lot of algorithm analysis, Knuth for
algorithm analysis, Simon for AI, Rabin for algorithms, Dana Scott for
logic, Backus for programming languages, Floyd for algorithms,
Cook for complexity theory (coining the notion of NP-completeness),
Thompsons and Ritchie for UNIX, Karp for complexity theory (more
early work in NP-completeness), Lampson for distributed systems,
Milner for logic and programming languages, ...

1966 A.J. Perlis
1967 Maurice V. Wilkes
1968 Richard Hamming
1969 Marvin Minsky
1970 J.H. Wilkinson

1971 John McCarthy
1972 E.W. Dijkstra

I agree that a Falcon for $350 would be nice but I don't see it
happening.... especially in the US. Although Toad plans on
importing C-Lab's clones I imagine that the price would be higher
due to shipping overseas. However, I don't agree with Mark that
the Falcon is just a fun hacker's machine. It is a great machine
that can do the job of most home users (a vast majority, I'd
say). The software support is lacking but Calamus, Pagestream,
Papyrus, NVDI, etc. do stand out as excellent products and applications
are available for almost every need.
Don't limit the Falcon to a toy to just eat away spare time- it is
a very serious machine.

WOW! an actually atari group on the net. I thought they went out of
fashion long ago.

It's a pity the Jaguar (I bought one) is so underpowered. It
might have done well otherwise.

Nuts.

--

Excuse me for butting in here. But after seeing some of the posts, I had
to make a comment. I started out with the old Atari 400 which I still
have. I then went to a 800 which I still have. I have modified them and

upgraded them and still use them. In that time I have also used
everything from the XL's, XE's, and ST's. And have went from the old
XT's, 286, 386 to my current 486 that I use. But I still have and use my
older 800 Atari. What does this say? It says that I still use and get
enjoyment out of it and have had no problems with it in all those years.
I even have spares on hand if I were to ever need them to fix something
if it were to break down. But so far I haven't. Can some of the others
who bad mouth Atari say the samething about the systems they use. I think
not. But like the man says, the users who do use it and get enjoyment
from it do not like the non-users who really don't know how or what Atari
is all about running off at the mouth. Its as simple as that. If you want
to argue the pro's and con's of it, take it to the proper base for that
type of discussion. And leave the rest of us alone. Long live Atari!

The Jaguar is *not* underpowered... in fact, it's a very advanced design.

The problem is that it's made by Atari.

William, I see you are from the dept of philosophy. A vocation I truly respect...I wish I could have studied more during my college years...

Anyway, on to my point. I don't know if you missed the beginning of this thread or not, but there were some very reasonable arguments as to why b gates is evil (IMO) or at least can reasonably be seen as being evil. The reasons given were not those listed by yourself.

The gist of the argument for him being evil is this: bill gates employs anti-competitive business practices that are discouraged by the US capitalistic system. He gets away with employing such anti-competitive practices which in turn depresses the US software industry by, among various other ways, decreasing the level of innovation (by bullying companies out of business, in Tucker-esque fashion). This depression of the US software market will not depress foreign software companies/nations, and eventually could lead to the US turning over its dominance in the software industry to a foreign competitor (much like the US auto industry did in the 70/80's). b gates does all of this knowingly. He puts his personal profits before the good of the US and its citizens. Thus, he is evil.

Certainly you may disagree with points in this argument, but it should be clear that this argument may (among many others more eloquently stated by others) can and is viewed as reasonable by sum. So, to discount wholesale people's wary glance upon the actions of b gates, and their opinions/categorizations of him as

blind aspersions without aforethought is rather condescending.

Some people came to this conclusion with some thought and after
revelation.

> Initiating physical force against another person is evil. The
> seizure of property earned through free trade is evil.

Hmm, besides, in a philosophical sense, I was never able to come
up with satisfying definitions of good and evil. They are so base.
Inevitably one is drawn to defining them in terms of themselves.
Good is that which is not evil and vice-versa. In a more pragmatic
sense, they might be defined as so: Evil is what does harm to my
personal good (or to the good of a group). In that sense I see b
gates' weakening of the US software industry as evil b/c US citizens
will surely suffer from the loss of yet another industry.

In article <tbyars-2607951251290001@tbyars.earthlink.net>, tbyars@overdrive.com says...

>the sig says it all....

>Microsoft's big break came in 1980 when it was chosen by IBM, over
>Gary Kildall's Digital Research, to write the operating system for IBM's
>new PC. Faced with a complex task and a tight deadline, Microsoft bought
>the rights to QDOS (short for "quick and dirty operating system") for
>$25,000 from Seattle programmer Tim Paterson and renamed it the
>Microsoft Disk Operating System. (MS-DOS)

IBM still offered CP/M-86, but it failed for many reasons:
a) Gary Kildall threatened to sue IBM because MS's DOS looked a lot
like CP/M. So IBM settled with Kildall by promising to offer
CP/M.
b) The price of CP/M-86 was $240. Kildall irritated IBM.
c) CP/M-86 was very late.

Also, note that had Tim Paterson held onto QDOS, it wouldn't have been
a big hit; in fact, it probably would have done nothing. My guess
is that Tim Paterson got more for QDOS from Bill Gates than he would
have peddling it on his own.

> HELL WOULD SOMEONE NEED MORE MONEY THAN 12 BILLION DOLLARS?!?!?!?!?
> JUST TAKE YOUR MONEY AND LEAVE US ALONE!!!!!!

This is an interesting point... But when I think about it, b
gates is very wealthy only on paper (yea, I'd like to suffer that
way too :). But his recent 12billion dollar man status is directly
related to the stock price. The price goes down, his net worth
follows. I'm sure on any given day he makes/looses hundreds of
millions of dollars. There are days where he looses billions. I
know he has cashed out some of his stock from time to time, not
sure how much though.

So he probably keeps at it for two reasons: 1) he wants to keep
balloning his wealth by affecting the stock, which he does by
running the company, and 2) he takes a salary for mundane living
purposes so he doesn't have to cash out stock....

I think that with the last stock market drop of MS stock prices, Bill's net worth has gone below 12 Billion. He's just trying to make some more to go back up past 12 that's all. He'll stop I'm sure, as soon as MS becomes the only software company and he's able to pay off the US national debt by himself.

```
: Microsoft's big break came in 1980 when it was chosen by IBM, over
: Gary Kildall's Digital Research, to write the operating system for IBM's
: new PC. Faced with a complex task and a tight deadline, Microsoft bought
: the rights to QDOS (short for "quick and dirty operating system") for
: $25,000 from Seattle programmer Tim Paterson and renamed it the
: Microsoft Disk Operating System. (MS-DOS)

From the Jargon file...

MS-DOS: A clone of CP/M for the 8088 crufted together in 6 weeks by hacker
Tim Patterson, who is said to have regretted it ever since. Numberous
features, including vaguely UNIX-like but rather broken support for
subdirectories, I/O redirection, and pipelines, were hacked into 2.0 and
subsequent versions; as a result there are two or more incompatible versions
of many system calls, and MS-DOS programmers can never agree on basic things
like what character to use as an option switch or whether to be case-sensitive.
The resulting mess is now the highest-unit-volume OS in history.

Often known simply as DOS, which annoys people familiar with other similarly
abbreviated operating systems (the system for the 360). The name further
annoys those who know what the term 'operating system' does (or ought to)
connote; DOS is more properly a set of relatively simple interrupt services.
some people like to pronounce DOS like "dose", as in "I don't work on
dose, man!", or to compare it to a dose of brain-damaging drugs
(a slogan button in wide circulation among hackers exhorts: "MS-DOS: Just
say No!") See mess-dos, ill-behaved.

Uhhh, what's all this crap about?

Bill Gates has products that are in demand. Other people profit from his products. Other companies profit from his products. He employs people to make the products. Bill Gates has done one hell of a lot more for this country than most of the whining idiots who bitch about him.

If you don't like his products DON'T USE THEM. It's very simple.

The people in this thread who don't like b gates may not have a
choice but to use his products...I personally do have a choice and
stay clear. But that is neither here nor there. The logic upon
which you base your obviously condescending and insulting position
would have been wonderful in the day of hitler. Well he says things
that a lot of german's at the time wanted to hear, and he's made
a lot of german's lives better, so if you don't like what he has
to say, just don't listen. No, sometimes in life you have to do
more than apathetically bend over and take it.

> evil.

> So do you, and most others as well. So we're all evil.

That is false. I don't, and I know of others that don't. In my life, I've had opportunities where I could profit, but the price was too much, namely my personal profit was contingent upon my screwing a my friends over. I chose (perhaps some might think foolishly) to be virtuous...Maybe not virtuous, maybe in the end it was out of selfishness...I look myself in the mirror, and as ugly as I am to start with, I couldn't take knowing an SOB was looking me back in the eyes.

And as much as I love my friends, I love this country (US) and couldn't live with myself knowing that I am screwing it over.

I think you are working under a fallacy, namely, that if you are rich, or if you want to profit you must be evil. There are many great, and wealthy men that made positive contributions to this country, and a boat load of money to boot. Thomas Edison to name one. My life would be much worse had he not made millions of dollars with his inventions. I cannot say the same about b gates' "contributions" (I use that term very loosely).

Furthermore, I think it is a fallacy that to 'redeem' yourself after making a lot of money (as if that were an evil in and of itself) you have to donate funds to charity. There is nothing wrong with wanting the good life, in and of itself. There is nothing wrong with achieving the good life, in and of itself. Why the hell should I care what a bunch of politically correct and jealous jerks think I should do with my money? And I don't think someone who made his money honestly, and not at the expense of others has any obligation to do anything with their money that they don't want to...and they certainly don't have any obligation to do what those PC jerks want.

: I beg your pardon...The Falcon is not competitive with the home market. Were
: is the apps? Why would one consider one when there are more software and
: hardware choices on the mac/pc platforms? What happens when the Falcon is
: kaput? Who will fix it? Not Atari.

Hummm....
I've had much less problems getting someone to work on my Atari ST
than I've ever had with that dang PC now in my closet. It's a 386SX no namer
that I bought in 1992. Lets see...first problem I had with it was that it
would only look at floppy disks formated by itself...or a computer of the
exact same type. Next thing I had to do was throw in two more megs of ram.
Then, I ran out of hard drive space after only installing about three
applications. Around one year later, I found that I could no longer find
any software that would support the monitor I had...so I had to upgrade to
VGA. The thing ran at a snails pace...even though it boasted screaming
cpu speeds well over twice what the stock ST runs. Next I tried to
install a simple sound card for 8 bit audio...I went thru 3 cards before
finding one that would work. The ST did this in stereo right out of the
box. It crashed at least once every single time I ever tried to use it.
And once I installed a Double Density floppy drive in it...and I called
over 10 shops looking for the correct rails to mount it in the drive bay.
No one had them...no one knew where to get them...so I wound up having to
get a local sheet metal guy to build a set from scratch!
As the story unfolds...the only reason I ever bought the 386
system was because some of our professors at school DEMANDED that everything
be turned in on floppy in Word Perfect format. Not long after that...I
found a used Super Charger for my ST for $75.00. Tried to sell my 386,
and no one would have it because it was already out of date (this was in
1993). I've been using the ST ever since and have moved into quite intense
areas of MIDI where the Atari serves my purposes very well. The old ST also
creates just as nice looking documents with Page Stream as a screaming
486, and doesn't take me more than 5 minutes longer to do it (only lose
this time cuz the ST takes a little time to compute a 300dpi page).
As I slowly grow into being interested in digital recording...the
falcon looks more and more every day like a dream come true. I could care
less what the number are that are in small print in the bottom of the box.
I just know I've seen these machines in action and they look pretty
competitive to me.
If a new PC is really so much faster...explain to me why it takes
windows about 4 times as long to draw a window than my 8mhz ST? My
computer at work (486DX 50 running OS2, it only connects to one
network) takes 6 minutes to boot! Hummm...also...the data base I use at
work, "Works" doesn't compute any faster than my AtariWorks at home, and it
also takes twice as long to load into memory...and only offer a hand full

of extra functions. Really...about the only advantage I can see in getting a PC/Mac over an ST is the fact you can have a much more colorful display at higher resolutions. We have to wait a few months to get some things for the ST, like web browsers and such..but they come..and are very solid programs once they do. As for the Falcon...I believe it has the colors...has the resolution...and tosses in some extra sound hardware as part of the package. Sounds like every thing a HOME user and most "non networking" professional users would ever need...and I reluctantly say "non networking" since the Falcon does come stock with a Lan port of some kind (doesn't it?)...not sure how good it is.

Oh well...Atari isn't a bad platform at all...
It is still very competitive as far the the machines themselves are concerned...
Some people are just afraid they won't get support for it...
Well...there aren't any Volvo, Mercedes Benz, or BMW dealers within miles of where I live...but I sure do see a lot of them driving around. Some have told me they drive 3 hours to the nearest dealer for service, but seem to feel it is well worth it. Also...one could pretty much compare the ratio of "Hard to get serviced" imported cars with that of Atari to PC/Mac ratios... Both sides seem to be happy in both cases...
So what's the big deal?

Brian

2365. ST to sell

Newsgroup: comp.sys.atari.advocacy

I didn't see any posts similar to this, so if this is the wrong place for my post, I apologize. (Where would be a better place to post this?)

I have a 1040ST with a color monitor and internal and external drives. I'd like to sell it.

Don't know whether any of you remember Antic and START magazines, but I bought the ST while a member of those editorial staffs. When I left Antic Publishing, I wasn't really able to use the ST much anymore. Everything's in fine condition.

Any ideas where to look for a buyer?

Thank you very much for any help.

Pete,
Yes, there is more software available for your precious Mac. How many
times must people admit to this before you'll let it drop. Of course,
there is also many more titles out for Intel machines than for Macs.
Respond to that. Why would people consider a Macintosh when a PC
has sooooo much more software support? Double standard?
I never said the Falcon competed (as far as market share anyway).
I said that it is powerful enough to accomplish the tasks for
most every home user. Some people have specialized needs that
the Falcon may not be up to task for but for a majority of users
the Falcon could get the job done. Does anyone disagree? I listed
some apps and if you want to know where to buy them pick up
a copy of ST Informer. Or call Toad. Or Steve's. Or B and C. Or
Computer STudio. Or ATY. Is it only okay to mail order if it
is from Mac Warehouse?
Finally, Atari does fix Falcons. Just send a broken one to them.
It will be awhile yet until parts for Atari computers disappear.
You are pathetically misinformed, Pete. BTW, how come no flyers
from computer stores in my area (Circuit City and Lechmere's, for
example) ever advertise the Macintosh? Only clones....
Oh, and the local Home Vision Video store (huge chain here in Maine)
just started advertising the Jaguar for rent.

2369. Rodger Sheppard: THE TRUTH:known reoffender

Newsgroup: comp.sys.atari.advocacy
Date: 1995-08-01 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <3vmdm2$5ad@status.gen.nz>
Source record: 11639
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

I am president of the largest Atari Club in New Zealand and am in a
position to tell those disgusted or intrigued or defendable, the following:

Rodger Sheppard is well known in Atari circles in this country for his
bad mouthing tactics, both on the net, on BBS here and general demenour
amongst those computer interested. It is also on record that he has tried
his verbal attitude on other computer platforms.

He is definitely not respected in New Zealand for his activities.

To those that think he has a right to state his opinions on the net,
think again. His mistake is that he has for a long time now abused his
priviledge and annoyed many people. He has destroyed his own credibility,
which is a great pity, since he has a wealth of experience.
The fact is, that he can have his say, everyone agrees with that, the
Atari groups have even been designed with this purpose in mind. It could
even be said that people are not using the facility enough, although I
understand that not all people get (or want?) to subscribe to *advocacy*.

The problem of course is that Rodger Sheppard is reknown for his impetuosity.
A welcome change perhaps, but a transgression in the long run.

We in New Zealand are completely, and absolutely sick and tired of Mr
Rodger Sheppard and the more people that take up the suggestion of Dan
and email his provider to complain, the better.

Thankyou.

Who are you to criticize my method of argument? You call capitalism
flawed? You compare me to Hitler? But you do absolutely nothing to
invalidate my opinions..

You say my position is "condescending and insulting." But you offer no reason as to why. Could it be that you're so insecure about your own opinion that the only way you can validate it is by calling those who oppose it hitler?

Interesting... =)

Don't get me wrong. I don't like Microsoft's products. I don't use them.

Well, nice chatting with you.

There Ain't No Such Thing As A Free Lunch. In this case I'm referring
to the fact that nobody gets rich without taking something away from
someone else.

I wouldn't use Edison as an example of someone who got rich without
taking advantage of other people. If you do, you should reread your
history.

All of your other examples are people who sell you pleasure. They
take their money in small chunks, but they're taking it nonetheless.
Each of them gives back to the community, but they keep a hefty
portion too -- otherwise they wouldn't be rich.

Gates, much as I don't like the man, isn't the antichrist. He's no
worse than any other entrepreneur, and better than quite a few.

I don't mean to turn this into a thread that would be better off in
alt.economics...

Paul Newman gives people pleasure. For that they pay him. No one is being
taken advantage of. Bill Gates gives people software, people pay him.
Again, no one is being taken advantage of. Edison gave us Direct Current.
We paid him. Everyone's happy.

Nobody gets anything "taken away" from them unless they're robbed. If two
people voluntarily engage in a transaction, both come out ahead.
Everyone's happy.

Nuff said.

- Sam

Well, believe me, I know the whole story (or at least as much as anyone
would need).

Edward> If it were not for Bill Gates and his abilities, you would not
Edward> now be sitting there typing this kind of nonsense.

If it were not for Bill Gates, there would've been someone else to step in
his truly mediocre computer shoes, who perhaps wouldn't have kept us in the
computing stone ages all these years because there might've been _actual_
competition and progress in the marketplace. And believe me, IBM is no
small part blameworthy for spawning Bill.

Bill Gates's strengths are his business sense, capital, and the VP that just
walked out MS's door.

Edward> Get a life and get real.

Your previous claim illustrates who needs to get real.

Bill Gates is, like many self-made billionaires, extremely frugal in some ways. Ross Perot drives a beat up red car (don't remember the type, but it was a Chevy or some such, nothing fancy). People who make that much money for themselves generally don't go around wasting it on unneeded expenses. Of course, you spend your money where you think it will do the most good. Bill Gates puts a lot into his company and into his house.

Oh, one other thing I forgot. I in no way am criticizing
capatalism...At least not the socio-economic democratic flavor of
capatalism practiced in the US. I think it is the best system
dreamed up to date. I'm not sure why you seem to think my post
implies this? If anything I would think that your TNSTAAFL theory
would be damning of a capatalism.

Ahh, ok, thanks. I'm familiar with the theory, just not the notation
:) Ok, theoretically/philosophically what you say is true. If we
were to judge that simply having money were evil b/c it takes away
from someone else, than almost everyone would be evil. That, however,
was not the basis upon which I was calling b gates evil. He is
evil b/c he is purposefully taking away from others by destroying
the competitiveness and eventually the entire US software industry.

The distinction is this...It's not evil to take money away from a
man's hands by happenstance, but it is evil if you chop off his
hand and take the money that way. In other words, I don't think
it's evil if you make the best product possible and it sells so
well that it runs someone out of business b/c their product stinks.
I think it is evil if you have a crappy product and use brute force
to drive a competitor with a better product out of business. This
is a very simplistic example, and a much greater dialogue than most
people would care to read (much of which has been explained in
earlier posts) would be required to show why on a philosophical/moral
level b gates is evil.

The bottom line, however, is this...b gates' actions go a long way
to making the US less innovative and less competitive, thus
threatening the future of the US software industry, b/c he does
this knowingly, he, IMO, is evil.

> > I wouldn't use Edison as an example of someone who got rich
> > without taking advantage of other people. If you do, you should
> > reread your history.

I wasn't trying to imply that any of these people were saints...Simply
that their products/actions greatly benefited people everywhere.
I know that he was, to put it mildly, a tough cookie to deal with.

> > All of your other examples are people who sell you pleasure.
> > They take their money in small chunks, but they're taking it

> > nonetheless. Each of them gives back to the community, but
> > they keep a hefty portion too -- otherwise they wouldn't be

Paul Newman keeps nothing from his food products. It all goes to
charity.

> > Gates, much as I don't like the man, isn't the antichrist.
> > He's no worse than any other entrepreneur, and better than
> > quite a few.

Yes he is worse. Unlike the aforementioned examples, he knowingly
is trying to make the US software industry less innovative, less
competitive, for his personal gain, and doesn't mind that his
actions may cost future US citizens our current lead in the software
industry. All of the previous examples, which does include
entrepreneurs, and more examples could easily be named, were
contributing to the level of US innovation. These people were
trying to succeed by giving the world a better life, not by retarding
progress.

> Paul Newman gives people pleasure. For that they pay him. No one
> is being taken advantage of. Bill Gates gives people software,
> people pay him. Again, no one is being taken advantage of. Edison
> gave us Direct Current. We paid him. Everyone's happy.

We won't be happy when we loose the software industry to India or
Russia. I wasn't happy when the US lost its domination of the auto
industry--although many Japanese citizens were. b gates certainly
does not make me happy (of course that is not his job). However,
if he were a little less greedy he could make me and everyone happy.
He certainly has it in his power to make products a million times
better than what is now coming out of MS.

Think of it...S Jobs and about 200 people built one of the best
hardware/software platforms of all time in several years. MS has
a billion times the resources and talent at their disposal, yet
the best they can come up with was windows? Doesn't that seem a
little fishy to you? Having frequent $90.00 upgrades is a great
cash cow to milk, but it is milking at the expense of the future
of the US software industry.

> Nobody gets anything "taken away" from them unless they're robbed.
> If two people voluntarily engage in a transaction, both come out
> ahead. Everyone's happy.

I agree. But with b gates we are not dealing with voluntary actions.
It is the clearest case of adhesion I have ever seen. I got an
intel box and I specifically asked that MS DOS/windows not come
with the system, yet it did. b gates made money off me even though
I really didn't want his products. People cannot choose to simply
not use MS product. MS, clearly, has the superior bargaining
position. Both parties do not come out ahead in the deal, only

MS. It is akin to a robber coming up to you and saying "your money
or your life." You agree to give up your money, now he is richer
with money, and you are richer b/c you still have your life? Any
deal made where the bargaining power is so clearly one sided is
akin to being robbed.

Hey, Butler Lampson works for MS. He is an "architect" in Advanced
Technologies (That's MS' research division -- the people who get to play
with nifty things like Interctive TV). In fact, he's pretty high up, with
apparently only one person between he and Bill.

> nothing to invalidate my opinions..

Read my signature, I'm John Kheit. And I'm just as good as anyone else to criticize or judge. This is a bit tangential, but I'll go with it anyway... I don't know where this politically correct notion came about, namely the "who are you to judge/criticize" idea? God gave me a brain, whether it's good or not, this brain is always making criticisms and judgements. We all do it, we just don't voice them b/c for whatever reasons it has become politically incorrect to do so; a rather hypocritical practice. Most of us on some levels are judgmental with people. I prefer to be open about my judgments and give the other party concerned a chance to see what I think. That way, he/she at least has the chance to correct my judgment if I am wrong (which is often the case) or benefit from my analysis.

I am not condemning you to a tomb with my criticism, for that I would have to be a real judge. I am simply saying, that for myself, I find your 'method of argument' to be rude, condescending and insulting. Imagine if in the middle of a conversation you were having with someone, I came up and said "everything you guys are saying is stupid...If you guys weren't so stupid you'd see that X-reasoning is the only intelligent way to see this issue." Would you welcome that kind of intrusion? Even if X-reasoning were valid, would you enjoy the manner in which it was presented? I hope you can see just how condescending and insulting your comments were. I'm not sure how else I could have interpreted them? I, personally, do not welcome that type of derogatory dialogue.

Moreover, I fail to see any method of argument whatsoever. What I do see is an insulting and overbearing opinion, and I quote "Uhhh, what's all this crap about?"

So in short, in your evaluation, my opinions, and those of others in the thread are deemed to be crap by you. You go on to back up that opinion by stating that b gates fills a demand, he makes products that people buy, and if I don't like it, I simply should not buy his products. Then I countered by showing how your reasoning is flawed by applying your rationale to hitler. Note, if you read it, in no way do I call or even imply that you are like hitler. I

don't know you well enough to be that insulting. What I think I
did demonstrate was that b gates is a software hitler, and
I for one do not wish to bend over apathetically and take it from
him, nor anyone else for that matter.

> You say my position is "condescending and insulting." But you
> offer no reason as to why. Could it be that you're so insecure
> about your own opinion that the only way you can validate it is
> by calling those who oppose it hitler?

First, I am rarely insecure about my opinions, when I am, I say
so. Furthermore, I don't need validation of my opinions. I actually
prefer to be proven wrong. People that show me to be wrong, do me
a great kindness by teaching me something I didn't know.

Second, I didn't call you hitler, re-read the post. As to why I
don't care to re-hash the arguments presented in earlier posts:
1) It is easier for you to re-read the previous posts in this thread
than for me to re-type them.
2) There are many people who, just like you, come onto a thread with
their omniscience and say "this is all crap", which implies that
they have the only _real_ way of thinking; if I were to bother to
explain it to everyone, I'd never get any work done.
3) I hate rudeness. Coming down and calling peoples' opinions
crap, especially when you haven't bothered to look up the arguments
presented, is rude. It's one thing to say "I disagree, here's my
take on it" and quite another to say "this is all crap." I don't
feel any obligation to go about servicing the whims of rude people.
The arguments are there, go back and read the thread if you truly
are interested in explanations.

And Mr. Lampson got the ***92*** award, which means that his Turing
Award work was done prior to '92. Probably a LONG time prior to '92.

When MS founded that division they went out and hired people like
Lampson and Rick Rashid to give it "instant credibility". Those
people did the work that got them well known ELSEWHERE and THEN
were hired by MS.

Bob

Why do you have to Lie all the Time I don't use BBS here at all,
so why the Lies is it because I refuse to reply to your e-mails and insults
and that I will never ever sell you a thing...

Please give this all up as all you are doing is showing how bad you are and no
credit to Atari at all..

PLEASE TRY AND GROW UP IF YOU CAN, as you are looking like a supid little Boy..

WRONG. Several local dealers have gone to the "OS and software is extra"
pricing scheme for selling computer systems. This helps keep their prices
down, since a lot of people already have DOS, Windows, OS/2, Linux, etc.
to run on the system and just want better hardware. These places usually
charge $99 to get DOS+Windows with the system. There are even a couple of
places that will sell you a system with LINUX pre-installed. Now, as far
as mass-market systems at Best Buy and Computer City, you won't find
anything else but DOS and Windows (including on IBM machines), since they
cater to a different clientele.

Which gives you a choice of at least
o MacOS
o AIX
o MacMiNT
o MagicMac
-- others anybody? OS9? OMEN?

Of course there is only one which you are *forced* to buy with *every*
Mac, whether you want to run it or not. Stop thief!!!

(Plus if you run MacOS you'll probably end up running MS apps -- MS
dominate the Mac apps market more than any other platform :>).

Sounds like IBM all over again. Overwhelming monopoly on the business side. Use these exorbitant profits to fund excellent research.

Look at TJ Watson Laboratories and other IBM research branches. Remember it was IBM scientists who discovered high-temperature superconductivity.

Very little of this excellent research makes it into the business products, which are really tuned to maximally squeeze the customers time and time again in upgrades and threats of incompatible competition.

Microsoft today is in a similar position to IBM of 1965 or so.

Message: computers will stagnate, competition will be cowed.
Buy MSFT shares.

: Bob

The point was that Bill Gates got his money even though he didn't want to
give any money to Bill. He had no choice. He couldn't by the computer
without giving money to MS. That's the whole point of this thread. Bill
Gates isn't rich because he makes a good product that everyone chooses to
buy, but that, in order to get a PC you also have to pay for DOS and
Windows. Which is why Bill Gates is rich.

Thanks for the support and I that find is quite easy to agree with.

It is nice though having it in advocacy, instead of fouling up the other groups where it doesn't belong!
Mr Shepherd is keen to slang off abou the Atari - then this is where he can have a ball, all encouragement to him! Also he and anyone else that wants to participate needs to see that this can be a contentious area...

He said he couldn't give the machines away, well that is not a problem Mr Shepherd. I know people in Wellington who would get a lot of enjoyment from taking them off your hands.

Then you said make me an offer. Again, no problem, Mr Shepherd, I have offered you the resource of our magazine advertising and country wide circulation to help find someone to buy your *amazing collection*.

You know, I am very keen to help you. the Atari fraternity here are a friendly bunch, if you are lonely, we'll even send you a bunch of flowers. we can even understand why you want to slang off about the Atari computer. We've seen people exhibiting your *Burnout* behaviour before. They generally move on, often very abusively, but find merrier climes. And it sounds like you have just found yours.

I just had to correct your idea that the Atari scene is dead here in New Zealand.

It is alive and kicking. We even have people with Power Macs and PCs in our club. They wouldn't be in the club, paying fees if they had no Atari machine. So it takes all sorts doesn't it Mr Shepherd!

And sure I emailed you to give you the opportunity to rest your gear. Like some people I know, they have long since moved on, but they still keep their Atari stuff. I guess there is some nostalgia in you too!

cheers Rodger - and - *(keep it in advocacy)*

Until Macs are actually given some exposure (like in flyers for computer outlets) I can't see the Mac taking off. Also, they seem to be very overpriced in my area. People are going to look at the Mhz of the machines and see that a 486DX 66Mhz is less expensive than a Power Mac running at 66Mhz. They'll also see the tons of software for the IBM compared to the miniscule Mac section. Finally, people know others with IBMs (hence "free" software). Does anyone disagree?

has anyone ever used a 19" monitor on a falcon?
is there any 19" that support both color and mono?
please let me know..

does a Moniterm work on a falcon?
can the falcon be modified to make it work?

how about the atari tt194 (i think this is the model number of this)
anyone know how much they go for and if they will work?

thank you

2412. Is anyone supporting Atari right now?

Newsgroup: comp.sys.atari.advocacy
Date: 1995-08-03 00:00:00 UTC
From: 91-23561@shaddam.usb.ve
Message-ID: <1995Aug3.182900.29612@usb.ve>
Source record: 11667

Hi everybody!

Since I've been quite isolated during the past few months I was
wondering if there's any support from Atari (to the M68k line) or if
there's any other company supporting those machines. Also is anybody
considering porting the Atari line to the Power PC? I think that should
be a good move (one that can bring the Ataris back from the limbo).

Any comment or notice please e-mail me back.

Thanks in advance!
Stefan Schneider C.
91-23561@shaddam.usb.ve.

This release of this product is tied to the release of the Jag CD. Since the JagCard will only run games from CD Rom. Has JagCD has not been released do not even think of this product.

I can't see that transferring capital to an inefficient, transitory computing paradigm does a lot for this country. Seems wasteful to me. Even counterproductive and inflationary, in the long run.

>If you don't like his products DON'T USE THEM. It's very simple.

No, it is not that simple. When you are in the real world, you have to deal with the reality. You have to deal with the choices other people make. I would very much like to not use them. In fact, for a number of years I explicitly rejected them, and made money off the fact that many people would get caught up in the hype, then need someone to throw the crap out and get something that works. However, a few years ago the hype and products reached a critical mass - large organizations

started making top-down edicts of the form that "every desk will have a peecee on it." This made for some ridiculous situations where the piles were (and still are) used just as vt emulators, but also drove the development of the important stuff to make the actual piles workable (sorta). This "sorta" is very important. Translated to English, it means that the products are going through a development phase that other products went through years ago, making the same or worse mistakes.
Bill Gates knew better - he started on RSTS, later he owned a piece of the unix world (to cover his bets IMO). So his genius lies not in computers, but in recognizing the business effects of marketing, the importance of intellectual property rights, the importance of limiting knowledge transfer, and plain old monopolistic practices.
Remember, Dad was a lawyer and Mom was on the board of banks and stuff.
What do you get when you cross a lawyer and a banker? :)
In this case, it looks like a shark who will continually eat all your money. Sharks - they eat you, you eat them, I guess it all balances out eventually. I wonder how long until Justice starts sharpening harpoons...

While it is probably wistful thinking about the computer, can you quote the
necessary followup contacts for the magazine so that the source may be traced.
Then a better analysis would be possible obviously.

True..The PC you have lots of more choices. However, the mac has plentiful
choices. The decision on what platform is upto the individual taste.

Sending the Falcon to Atari can be risky. You may not get it back. I have
seen lots of flyers for the Mac. Best Buy had plentiful stock. I have not
seen the Jagflop yet. I was in babbages yesterday in West Des Moines, not
jagflops but plenty of 3do's and Saturns.

Thats funny. The $1500 Performa 631 system is very competitive with a 486 setup. The P631 is also being advertised running at 66 mhz as well. More of a marketing gimick.. Plus there PowerPC Performa Macs which are price competitive with similar Pentium set ups. Plus on monday when the new PCI Macs will even further the price/performace ratio.

Plus Apple is selling all the Macs it can make..Like 5-6 million this year.

Depends on how you define 'at the expense of others.' We clearly disagree
on what that definition is. You seem to be of the opinion if I make one
penny it's at the expense of someone else. I see that definition as being
less than useful.

Well, technically you are right. The emphasis should be placed on
Several dealers. This is still not the norm. And, most important
vis a vis this thread, it is after the fact. b gates has already
made his fortune by employing this illegal technique of forcing
everyone who bought a pc to give him money for his OS. Now, is
too little too late for many companies that may have had a chance
to do well had it not been for b gates' and MS's illegal practices.

> If a new PC is really so much faster...explain to me why it takes windows
> about 4 times as long to draw a window than my 8mhz ST?

For one thing, the ST has an anemic and extremely substandard video system by todays standards.

In ANY resolution, the maximum amount of screen memory the system has to move around is 32K.

The monochrome display is the only one even approaching the resolution of most PC displays, and that's only with 2 colors.

A 640 x 480 display on a PC with 256 colors (a very "standard" style of display) by contrast uses over 300K.. almost ten times the memory to move around.

Secondly, the ST windows are VERY low detail. The display on a PC running MicroSoft Windows is much more highly detailed, from the windows themselves to the icons displayed.

Thirdly, if your PC takes four times as long as an ST to draw a window, either the setup is all wrong or it's broken.

(Incidentally, six minutes for OS/2 to boot up is excessive, if true. It sounds like it's not set up properly.)

BobR

Calling a Lexus "nice" is like calling Windows nice. Give me a
BMW and NeXTSTEP any day. A Lexus does have, what many Yuppies
bought BMWs for: a certain amount of horsepower and luxury. However,
when the road get twisty any sport car enthusiast can tell the
difference. The analogy applies to a comparsion to the OSes as well.
Both have windows, buttons, forms, etc, but when the task gets
challenging, NeXTSTEP will win hands down.

BMW calls their cars the ultimate driving machines. NeXT should
call their system the ultimate environment.

Saw a poster at a BMW dealer which said: "someone scratched a Lexus
and found a Toyota underneath. I suppose one could say: "scratch
Windows and one finds DOS underneath.

True.

Utter bullshit. Drawing primitives like close buttons etc. is independant
of their design, the same is true for icons. Just their size is relevant,
as it means more memory operations to change more pixels.

Secondly: Windows is a piece of crap.

May I just say that people who engage themselves in this kind of mudslinging are merely demonstrating their childishness and lack of sense. If you are sensible, you realize that replying to an affront merely a) shows you are no better than the other guy and b) it will only lead to destruction. I mean, this place looks like ex-Yugoslavia or Northern Ireland. Just realize that the guy who is behaving badly is only making a public display of his own foolishness.

Use your killfiles and improve the signal/noise ratio, please!

Hi, Bob!

BobR (76702.1466@CompuServe.COM) wrote, in answer to this question:
: Q> If a new PC is really so much faster...explain to me why it
: Q> takes windows about 4 times as long to draw a window than my
: Q> 8mhz ST?

BobR: For one thing, the ST has an anemic and extremely substandard
BobR: video system by todays standards.

If the original posting wanted to know why a a PClone was four
times *slower* than an ST, criticizing the ST's video system
doesn't exactly answer the question!

BobR: In ANY resolution, the maximum amount of screen memory the
BobR: system has to move around is 32K.

BobR: The monochrome display is the only one even approaching
BobR: the resolution of most PC displays, and that's only with
BobR: 2 colors.

... and that monochrome display was designed in 1985. Is it any
surprise that comparing it to a _1995_ display makes it seem just
a trifle ... um ... dated and less capable?

... and how long did it take the PClone world to catch up to the
capabilities of the Atari monitors of 1985? Two years? Three?
Or maybe it took the same time frame it took Microsoft Windows to
approach the usefulness of GEM: 6 years. (N.B.: That's counting from
the time the ST was introduced with GEM. I know GEM existed on
PClones before that, as did Microsoft Windows).

BobR: A 640 x 480 display on a PC with 256 colors (a very "standard"
BobR: style of display) by contrast uses over 300K.. almost ten times
BobR: the memory to move around.

No wonder the PClone is measurably slower in screen updates!
It's moving around ten times more memory! Assuming the CPUs
were equally efficient, it would therefore take an 80 MHz
PClone to match an 8 MHz ST!

So, based on this one-to-ten speed ratio, what PClone would
match the video capability of a 16 MHz MegaSTE?

Or a 32 MHz Falcon?

And how much do they cost (if available)?

BobR: Secondly, the ST windows are VERY low detail. The display
BobR: on a PC running MicroSoft Windows is much more highly
BobR: detailed, from the windows themselves to the icons displayed.

Detailed? Hmmm ... I'd agree to "overwhelming". I've been showing a new PClone user at work the finer points of Microsoft Windows: he's found it so involved and UNintuitive that it's a frustrating experience for him. And to make a bad situation worse, some systems (I'm thinking Packard Bell here) don't even come with sufficient MS-Windows documentation for the new user!

Besides, Microsoft Windows doesn't have proportionately-sized scroll bars to indicate the overall size of the document you're working on. It would seem that by not offering this feature, Microsoft Windows is actually *less* detailed.

That's really quite a trick -- supplying *less* *detailed* software that is somehow still *overwhelming* to your customer!

I'll keep my ST, thank you.

BobR: Thirdly, if your PC takes four times as long as an ST to
BobR: draw a window, either the setup is all wrong or it's broken.

Since the PClone starts with an inefficent microprocesser (necessary for compatibility with predecessor chips going back to the 8080), then adds an inefficient operating environment in the form of Microsoft Windows (c'mon now, 8 megabytes of RAM just to start a non-trivial program? What goes on in all that space, anyway?), it's no surprise that anything less than a '486 running at 90 MHz will be measurably slow to an ST user.

: BobR

There's a difference between 'taking something away from someone else'
and 'offering products that consumers freely choose'. If one does the
latter, and gets rich, more power to him/her. Exactly what did an
entertainer (examples: Paul McCartney, Bill Cosby, Pro Sports Stars)
'take' from anybody?

|> Gates, much as I don't like the man, isn't the antichrist. He's no
|> worse than any other entrepreneur, and better than quite a few.

There are many unethical entepreneurs, and far more ethical ones.
Bill Gates has demonstrated that he will shade every decision he makes
to push the letter of the law as far as it can stretch to achieve
monopoly profits, and has demonstrated little, if any, care for
ethics.

: > drives is a nice Lexus. -- /~~~~ / /~~~ / /~~/~~ gns2@po.cwru.edu /

: Calling a Lexus "nice" is like calling Windows nice. Give me a
: BMW and NeXTSTEP any day. A Lexus does have, what many Yuppies
: bought BMWs for: a certain amount of horsepower and luxury. However,
: when the road get twisty any sport car enthusiast can tell the
: difference. The analogy applies to a comparsion to the OSes as well.
: Both have windows, buttons, forms, etc, but when the task gets
: challenging, NeXTSTEP will win hands down.

[Digressing a little bit]

Yep. BMW's are both a luxury and sports car too. Case in point: the BMW M3
or 540i.

I suppose you could call the Lexus car the equivalent of Windows. Conservative,
relatively commonplace, a bit stodgy and tired looking, and not much of a
memorable driving experience.

: BMW calls their cars the ultimate driving machines. NeXT should
: call their system the ultimate environment.

:-)

: Saw a poster at a BMW dealer which said: "someone scratched a Lexus
: and found a Toyota underneath. I suppose one could say: "scratch
: Windows and one finds DOS underneath.

This is the problem - that the Lexus is still... a Toyota. You'd be close to
the truth if you thought that the switchgear was pulled from a level entry
Corolla. It's also the same company that eariler tried to pass the Crown off
as a Luxury car...

The how much?

Performa 5200:

~2100 US$s (8 MB, 500 MB, CD-ROM, keyboard, mouse)

PowerMac 6100:

~2100 US$s (apparently without keyboard)

Both prices given by Apple.

Scratch a BMW and find an Isetta underneath.

(For the auto-impaired, BMW used to make those stupid little cars that make old Subarus and Pintos look like luxury).

IMO, cars and computers should be adapted or at least adaptable to the task at hand. "Ultimate driving machine" my rumpus. My ZR will blow off any beemer, including an M1. I'd hate to drive it on the southern california freeways every day. So I don't. I noticed when I bought my LSC all Lincoln dealers had at least a few beemer tradeins - especially 630's. It cost less than 3 years depreciation on a 630, the trunk is bigger, it doesn't burn itself out after a couple of years, it doesn't break your back on the freeways. And it handles pretty well on the twisties, and the police tend to ignore it unless you go blasting past them (a mistake I've made on a couple of occasions, 'cause it really goes a lot faster than you expect, being basically a t-bird with a hopped up mustang engine). And with 200,000 miles on it, it just passed smog without even being close to the limits.

So don't insult good systems by comparing them to marketing dweebishness!

Not a member of any Jihad, but a Mac, PC, and ST user, I'll take the bait, admit the truth of your statement, and then direct your attention to the other front page article on the same issue of macweek...the article which explains how WIN95 compares with the current MacOS. The article concludes that WIN95 has some very Mac-like feature (the article title is "WIN95 GUI Catches Up") and even outshines the current MacOS in some areas. The big "but" comes with the uncertainty of how 95 will work in any specific user's configuration. Conversion to 95 seems risky...IMHO the best way to get a fully functional copy of 95 is to order it pre-installed from a clone vendor.

Copland is in reality the OS for CHRP, and as such the proposed release date is still about where it should be.

As for 95, even Bill Gates admits that it is an interim product to fill the gap until the INTEL world goes to NT. The INTEL machines I'm responsible for will NOT go to 95 if an upgrade is required, but NT.

peace,
paul

Apple's on the defensive alright. That's the real reason for
Sinclap's mysterious disappearance. The theory that Sinclap has
disappeared because he's finally found a (human) girlfriend is
about as likely as the Ptolemaic theory that the Sun revolves
around the Earth.

:I'm not saying that the Mac is a bad machine, I'm just saying that
:it's role in the future of computing is uncertain; possibly very shaky.

I don't think the Mac is a bad machine either. In fact, in many
respects, it's a pretty damn good one. There's no denying that it's
architecturally superior to the PC. But there is just no way Apple
can they can compete with the Microsoft juggernaut. Even the education
and desktop publishing markets, Apple's strongholds, can't hold out
forever.

I hate to say it, but I think that "Windows everywhere" will soon
become a reality.

:>I will be looking forward to the response from the Mac Jihad.

>monopoly profits, and has demonstrated little, if any, care for
>ethics.

It has long been said that business and ethics do not mix. Do be a
good businessman you must attempt to use every method at your disposal
to create an advantage. That's the nature of the game.

I'll take Gates any day over the likes of the people that not only
behave unethically, but who also manipulate our legal and judicial
systems in order to give themselves further advantages. You're
probably familiar with some of those companies since virtually every
large business in America is in that group, including (but certainly
not limited to) GM, GE, AT&T, Prudential, and IBM.

Here is a list of Atari ST software and hardware that I am selling.
All reasonable offers will be considered.

BBS:(412)343-1422
Internet: asmodeus@telerama.lm.com

ATARI HARDWARE FOR SALE
hard 1040 ST/F 4megs mem., tos2.06 TEC board, ADspeed 16mhz upgrade.
hard 1040 ST/F(M?) 1meg memory MIGHT BE 520
hard 1040 STE 4megs mem.
hard 3 Color Monitors (1 not working - power box) All atari brands
hard SM124 Mono Monitor
hard Indus GT External 720k Floppy
hard The BEst TrackBall
hard The Cordless Mouse (Practical Solutions)
hard Toadfile 130meg + 80meg HD w/ICD+ host
hard ShoeBox 80meg HD w/ICD+ host
hard Mouse Master
hard Monitor Master(toad brand?)
hard Video Key
hard ST Video Digitizer
hard The Complete Colour Solution (Vidi-ST, Vidi-RGB and VidiChrome ST)
hard Stereo Replay audio digitizer
hard ST Sound Digitizer (Hippopotamaus)
hard 2 assorted internal floppy drives for parts
hard 1040 case and rf shield (used)

ATARI SOFTWARE FOR SALE
soft Arctic Fox
soft Atari 1st Word ST (2 of them)
soft Atari ST Academy
soft Atari ST User Magazine: Disks: Oct 1990 - Sept 1991, w/2 unknown demo disks
soft Autoduel
soft Backup! (Michtron)

2453. Re: Power with out the price....

Newsgroup: comp.sys.atari.advocacy
Date: 1995-08-10 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <95222.182153STIRRE31@MAINE.MAINE.EDU>
Source record: 11608

$2,000 for any computer takes it out of the price range for most
consumers, I'd say. Also, 486DX machines are commonly spotted
at under $1,000. I have never seen a Mac in a store for under
$1,000 and I'd say that many people still perceive the Mac as being
overpriced. Couple this with the lack of software (compared to
the Intel machines) and the hype of how Windows 95 wil make
computing, oh, just so fun and easy and I think Apple is in
a heap of trouble. Am I happy about this? No. Unlike Sinclair
I don't revel in watching choices for consumers stamped out.
I read an article in today's Wall Street Journal which recommends
a Pentium with a gig of hard drive space and 8 (preferably 16)
megs of RAM to run 95. This is quite pathetic. Besides, there is
enough software on my Falcon to keep me happy for awhile. I can't
seem to catch up with the shareware and commercial releases.
I have a great DTP program (PS 2.1), a nice word processor (AW)
and simple graphics and music apps (pd). I can't even keep up
with the games (Substation, Obsession, Llamazap, Elite II, Cannon
Fodder, Towers II, stuff from David Munsie and all of the classic
games out there).
Well, there's another one of my rambling posts :-). I guess to sum
it up, I'd say, use what you want because unless you pirate, there
is plenty of good software to empty out your wallet on any platform.
There should be choices and _no_ standard.
-scott tirrell

What makes you think that they can't now? I read a press release stating that
Mac unit sales will be 25 percent higher in the September quarter and 50
percent higher in the December quarter from last year. Soo much for the doom
and gloom.

Plus with the new cheap PCI powermacs, Apple will hold its own.

Lets not forget to throw MS and b gates onto that barbee :)

Personally, I won't take any of the bad over any of the other bad.
Kind of like asking me to take the lesser of these evils:

Either I'll poke one of your eyes out, or chop any 3 of your fingers
off, go ahead and choose...

Although, I imagine there is a lesser of evil to choose from, at
that extreme level of badness, I cannot comprehend nor appreciate
any difference.

However, we obviosly disagree as to what level of badness b gates
represents. I think he is worse than all the aformentioned companies.

The use of the legal system by MS is very well known. Look at the
surprise in the industry when Stac had the guts to stand up to MS.
In a recent action MS attemped to grab access to confidential
documents of their competitors that had been subpoened by the DOJ.
The judge counted 20-some MS lawyers at the table.

MS use of its influence with the Washington State congressional
delegation is powerful enough to make some of those people double-
cross their most faithful constituents.

Gates office in "building 8" is surrounded by :

1) execs
2) security
3) lawyers

Those are the occupants of building 8. Wonder what the mindset is in such a place ?

Bob

Not soon enough... then again, yesterday wouldn't be soon enough for
Apple right now.

>Soo much for sour grapes..

Ha. We'll see if Copland makes it out by mid 96. In the meantime,
Win95 will proliferate and spread, and consumers everywhere will see
one less reason to buy a Mac.

BTW, Sinflop... Win95 production code is on its way. Win95 WILL ship
August 24.

:Ha. We'll see if Copland makes it out by mid 96. In the meantime,
:Win95 will proliferate and spread, and consumers everywhere will see
:one less reason to buy a Mac.

If it is indeed true that Copland is still in pre-alpha, it's chances
of being released in mid-1996 are close to nil. An early 1997 release
date is more realistic.

:Who needs a mascot... that's why we have Peter Sinclair!

I thought Peter Sinclair *WAS* the mascot!

You have not looked hard enough. I purchased a New Mac 630 with cdrom for
$999. Apple is in not in any heap of trouble. Apple needs to get their
manufacturing act together and eliminate the backlogs.. I have access to
plenty of software with lots of choices. Many of us buy from the catalogs due
to low price and convenience.
